PREFACE

THIS Introduction to Public Finance is intended to be an elementary text-book. It contains a simple outline of those things which are necessary to prepare the student for independent research; a brief discussion of the leading principles that are generally accepted; a statement of unsettled principles with the grounds for controversy; and sufficient references to easily accessible works and sources to enable the student to form some opinion for himself. The references that are given are not so much for the purpose of sustaining the author's statements, which any advanced student or teacher can easily trace to their sources, as to enable the beginner to add to his information on points that are of necessity briefly treated here.

Both the American and the English systems of taxation are badly in need of reform. Public opinion is gradually awakening to this need. Financial questions are widely discussed. There can be no doubt that the most pressing reforms of the close of the nineteenth century are tax reforms. The rapid extension of governmental functions — the invasion by the government of fields of activity that lie near to the welfare of the people — has given rise to great interest in the financial side of

these activities. It is hoped that this work may be helpful in the accomplishment of these needed reforms.

The Introduction to Public Finance can be intelligently studied by any person already familiar with the general principles of Political Economy. Technical details and wearisome tables of statistics have been avoided wherever possible. Abundant references to statistical compilations are, however, given, so that such matters can be readily looked up if wanted. The countries whose financial systems have been chiefly used to illustrate principles are England, Germany, France, and the United States; other countries have been drawn upon only for particularly pertinent examples. A brief but complete history of the financial practices of the four countries named has been given. The countries most extensively studied are England and the United States. Although the book has been written from the point of view of an American, the author ventures the hope that it may not prove the less useful to English students.

CARL C. PLEHN.

BERKELEY, CAL., August, 1896.

TABLE OF CONTENTS

INTRODUCTION

SECTION 1. Definition, scientific character, and relations of Public Finance. SEC. 2. History of the science. SEC. 3. Method and subdivisions of the subject. SEC. 4. Desirability and feasibility of a single method of classification throughout the whole subject. Page 1

PART I

PUBLIC EXPENDITURE

CHAPTER I

THE NATURE OF THE STATE ; ITS FUNCTIONS AND THEIR CLASSIFICATION

SECTION 1. Political science sets no definite limits to the extension of State functions. SEC. 2. Public Finance finds a limit in the revenue-yielding strength of the State. SEC. 3. Public expenditure in early times. SEC. 4. Public expenditure in Greece and Rome. SEC. 5. Fendal expenditure and the beginnings of modern. SEC. 6. Classification of expenditure. Page 17

CHAPTER II

EXPENDITURE EXCLUSIVELY FOR THE COMMON BENEFIT

SECTION 1. Expenditure for general administration. SEC. 2. Expenditure for the legislative department. SEC. 3. Expenditure for public buildings. SEC. 4. Expenditure for defence. SEC. 5. Expenditure for means of transportation. SEC. 6. Expenditure for education. SEC. 7. Assistance of private industry and commerce. Page 33

CHAPTER III

EXPENDITURE FOR THE BENEFIT OF INDIVIDUALS

SECTION 1. Expenditure for charities. SEC. 2. Pensions. SEC. 3. Bounties and "protection." SEC. 4. Expenditure for the administration of justice. SEC. 5. "Betterment" of property. SEC. 6. Expenditure in public industries. Page 53

PART II

PUBLIC REVENUES

CHAPTER I

THE CHARACTER AND CLASSIFICATION OF PUBLIC REVENUES

SECTION 1. Early forms of revenue. SEC. 2. The growth of constitutionalism results in uniformity of the revenue systems of the different countries. SEC. 3. Different States find the same justification of taxation. SEC. 4. Compulsion is universal. SEC. 5. Classification of revenues, definitions of fees, taxes, and prices. SECS. 6 and 7. Further considerations on classification. Page 69

CHAPTER II

THE CLASSIFICATION OF TAXES AND FEES; DEFINITIONS

SECTION 1. The measure of taxation distinguished from the justification; benefit theory and faculty theory. SEC. 2. Difficulties in the classification of taxes. SEC. 3. Direct and indirect taxes. SEC. 4. Taxes on persons, property, and income. SEC. 5. Other classifications of taxes. SEC. 6. Classification of fees. SEC. 7. Economic revenues. SEC. 8. Definitions of various terms used. Page 83

CHAPTER III

THE TAX SYSTEM

SECTION 1. All nations use many different taxes; no single tax feasible. SEC. 2. What, in the opinion of nations, constitutes

the ideal of correct or just taxation. The benefit theory ; the legal theory in the United States. SEC. 3. The faculty theory ; what constitutes faculty. SEC. 4. Other theories and progression. Page 105

CHAPTER IV

THE DEVELOPMENT OF TAXATION BEFORE THE INDUSTRIAL REVOLUTION

SECTION 1. Feudal dues commuted, and voluntary contributions become taxes. SEC. 2. History of taxation in France. SEC. 3. History of Crown taxation in England. SEC. 4. History of local taxation in England. SEC. 5. Colonial taxation in America. Page 123

CHAPTER V

THE DEVELOPMENT OF TAX SYSTEMS SINCE THE INDUSTRIAL REVOLUTION

SECTION 1. The effect of the industrial and political revolution. SEC. 2. General outline. SEC. 3. Development of taxation in Prussia. SEC. 4. In France. SEC. 5. In England. SEC. 6. In America. Page 144

CHAPTER VI

EXCISES

SECTION 1. Comparison of excises and customs ; and direct consumption taxes. SEC. 2. Purposes and principles of the excises. SEC. 3. Method of assessment. SEC. 4. Typical excises. SEC. 5. Proper field for excises. Page 169

CHAPTER VII

CUSTOMS DUTIES

SECTIONS 1 and 2. Customs duties defined. SECS. 3 and 4. The purposes of customs duties, both fiscal and political. Protective and revenue tariffs. SEC. 5. The protective principle widely applied. SEC. 6. The tax character of protective duties. SEC. 7. Customs duties as a source of revenue. SEC. 8. History of customs duties in England. SEC. 9. The German customs union and the Imperial tariffs. SEC. 10. History of the French tariff. SEC. 11. Tariff history of the United States. Page 182

CHAPTER VIII

PROPERTY TAXES

PART 1. *The General Property Tax*

SECTION 1. Theory of general property tax and the objections to it based upon the experience of the United States. SEC. 2. Scientific judgment of the general property tax. Page 208

PART 2. *Special Property Taxes*

SEC. 3. The land tax. SEC. 4. Building tax. SEC. 5. Taxation of capital. SEC. 6. Inheritance tax. Page 219

INTRODUCTION TO PUBLIC FINANCE

INTRODUCTION TO PUBLIC FINANCE

INTRODUCTION

SECTION 1. Public Finance deals with the way in which the State acquires and expends its means of subsistence. It stands in somewhat the same relation to the State that Political Economy stands to the individual. If Economics may be defined as the science which deals with the activity of the practical reason in acquiring and applying those things that are provided in comparatively limited quantities, for the satisfaction of the external and temporal wants of man, then, adapting our definition to somewhat the same terminology, Public Finance may be defined as the science which deals with the activity of the statesman in obtaining and applying the material *Definition.* means necessary for fulfilling the proper functions of the State.

Public Finance is properly called a science, because, (1) it deals with a definite and limited field of human knowledge; (2) *Properly called a science.* it admits of an orderly arrangement of its facts and principles, and contains many

laws of general progress belonging exclusively to its own field; (3) it admits of the application of scientific methods of investigation; (4) it foresees as well as explains a certain class of phenomena; (5) it is generally, if not universally, so regarded.

A dependent science. It is, however, a secondary or dependent science. It is closely related to two

other sciences, upon which it properly depends. These are Political Economy and Political Science.

While, on the one hand, it draws largely upon the conclusions of these two sciences for its hypotheses, yet on the other it contributes much to them.

Most of the prominent German writers on the subject regard Public Finance as a corporate part of Political Economy. It is properly so regarded, because the activities of the State that belong to this field are of such a nature as to consume wealth, produce wealth, and to interfere with the distribution of wealth. From Political Science we shall have to borrow many conclusions as to the nature of the State, and as to the functions of government. A determination of what the proper functions of the State may be is no part of our subject, but belongs wholly to Political Science.¹

In general it has been found best to assume that the functions now actually performed by the States are proper, provided they are not clearly

¹ For discussions of that part of the subject the reader is referred to Bluntschli's *Theory of the State*, Wilson's *State*, Hoffman's *Sphere of the State*, and Crane and Moses' *Politics*.

contrary to some generally accepted principles of Political Science. We are thus relieved of the burden, assumed by many writers on the subject, of attacking or defending the actions of different governments in matters as to the propriety of which there is some question: for example, the propriety of the continuance or assumption of State ownership of railroads, or the State monopoly of tobacco. All such matters will be treated purely from the fiscal point of view.

Information concerning the facts with which the science of Public Finance deals can, in most instances, be definitely ascertained, and the conclusions drawn have often a *The Art of Public Finance.* sharpness and distinctness lacking in many other parts of Political Economy and Political Science. There is, consequently, the temptation to create the corresponding Art of Public Finance. For when any science becomes at all "exact," it is easy and often desirable to point out possible direct applications of the truths learned. But although it is of the utmost importance that statesmen should be guided in their actions by correct principles, it is in no sense the duty of the scientist, as such, to make the application of the laws he may learn. Scientific investigation should precede, and ever remain independent of, any possible use of the truths discovered. In no other way than by the search for truth for its own sake, can we obtain absolute clearness of view.

SEC. 2. Public Finance, as a science, is older than Political Economy. Indeed, it is not incorrect to say

Older than that it was the forerunner of both the
Political sciences to which it is now tributary.
Economy.

For the writings of the Cameralists dealt more fully with this part of the field of Political Economy than with any other. Public Finance as an art, and as the subject of more or less conscious study, necessarily arose as soon as there was a distinct separation between the income of the Government, or the State as such, and the income of the Prince:—that is, as soon as any direct levy was made upon the wealth of the citizens, or any property administered, to secure a revenue for an acknowledged public purpose broader than the mere support of the Prince's household. The necessity for officials properly trained to administer the vast princely and public revenues that flowed into the public coffers led to extensive studies in just this line; and then the investigation into the origin and causes of the wealth of nations, as the foundation and source of public revenues, was the step which led to the birth of the greater science.

The writers on the Cameralistic science (which, because it at first embraced but little more than the matter now included in Public Finance, may be properly claimed as our science under another name) were stronger in Germany than elsewhere.¹

¹ For an account of them see Roscher, *Geschichte der National Oekonomie in Deutschland*.

On this account the science has always had a stronger hold there than in France or England. In those countries the lead of the Physiocratic doctrine, the powerful influence of Adam Smith, and, after his time, the intensity and rapidity of industrial development, directed the attention of students in such fields to the more general and more absorbing questions. Although Adam Smith himself devotes one book to the discussion of finance, and other writers of note give it passing attention, it was extremely slow in obtaining independent recognition. The predominance in both England and France of a theory of State which minimised the importance of government action may in part account for this neglect. The one part of the subject that did receive attention—namely, taxation—dealt with an activity that was admittedly necessary. But other fields, like that of expenditure, were comparatively neglected. The same blindness which led English economists to underrate the importance of a study of consumption, except so far as it led to new production, prevented them from seeing anything worth studying in State expenditure beyond, possibly, its effect on new revenues. Hence it is that while Germany piled treatise on treatise, all deep, scholarly, and broad, covering the whole subject of Public Finance, we have had to wait until 1892 for a systematic treatment of the whole field in the English language,

*Only parts of
the subject
treated by
English
writers.*

and we still await such a one in French.¹ It must not be understood that portions of the subject were not investigated. There are, on the contrary, many important works on the various parts of the science. But what was entirely lacking until the appearance of Bastable's *Public Finance*, in 1892, was an attempt to systematise the whole subject.

Financial problems are becoming more important, because the functions of government which depend on them have grown in importance and number. Our industrial, commercial, and social organisation has become more and more complex, and it hence requires better and more effective governmental organisation to keep it running smoothly. The more important it becomes to perfect our governmental organisation, the more do questions affecting the supply and application of material support rise into prominence. Whether we regard the constant expansion of the State's activities with favour or disfavour, it is equally important that the financial problems arising from these activities should be solved. Accordingly Professor Bastable's work has been followed by a flood of special articles, by the announcement of a treatise by Professor H. C. Adams, and by a translation of some of Professor Cohn's published writings on the subject.

¹ Leroy-Beaulieu, however, covers all but expenditure in a masterly manner.

SEC. 3. On account of the close relation existing between Public Finance and Political Economy, most of the discussions as to the proper method for the latter bear with equal force upon the former.¹ But the nature of the materials with which Public Finance deals is such that in general the inductive method has a wider possible scope, and the deductive a narrower field than in the larger science. The historical and comparative method is most serviceable for ascertaining the conditions under which different kinds of taxation work. The general effects of taxation, its shifting and incidence, the effect of expenditure and public debts, can be best studied deductively. The deductions in this case are derived from the conclusions reached by the previous method, and from principles derived from Political Economy. Inasmuch as the purpose of the present book is merely to expound principles already determined by the science and to use the facts of financial practice rather as illustration than as proof of the doctrines advanced, it will not be necessary to acquaint the reader, in each case, with the method used to ascertain the truths stated. In the main, therefore, we shall follow what has been aptly called the method of instruction, which is in a sense an inverted induction, in which the principle is first stated and then sufficient facts are adduced to show that the principle is true.

¹ Cf. Keynes' *Scope and Method of Political Economy*.

*The same
methods avail-
able as in
Political
Economy.*

The subject falls naturally into four parts: (1) Public Expenditure, (2) Public Revenue, (3) Public Debts, (4) Financial Administration. *Division of the subject.*

Of these, Public Expenditure and Financial Administration have, until recently, not been the subject of important works in the English language, and, therefore, a few words in defence of their incorporation are necessary. Public Expenditure is as much a part of Public Finance as Consumption is of Political Economy. While it belongs peculiarly to Political Science to determine what the lines of expenditure shall be, just as it belongs to Ethics to teach the individual in what direction he should use his wealth, yet, when the lines of expenditure have been determined, its form, amount, and effect belong to Public Finance, just as the form, amount, and effect of consumption belong to Political Economy. Consumption, or the satisfaction of wants, is the end and aim of all production and distribution. So is expenditure the end and aim of the collection of revenues and of the other financial activities of the statesman. To exclude, at least, a statement of the forms and the customary direction of expenditure would be to overlook the purpose of all the rest. But there is still another consideration that emphasises the need of a statement of the general objects of expenditure. The amount of expenditure is generally determined first, and after that has been settled the required revenue

Expenditure should be included.

is obtained. In this Public Finance differs materially from Political Economy. In the broader science it is generally assumed that the individual cannot regulate his income by his wants, but must limit his wants to his income. In some cases this difference fades away. Cities often have to forego, temporarily at least, desirable improvements on account of the increased burden they would impose on the finances. But in general we find that the modern State is quite as likely to neglect some important and desirable function which it could perform, as to increase its functions beyond what would be wise.¹ If this is true, and that it is so will be seen in the course of the discussion, then it would be well to ascertain the main features of expenditure at the outset. But we are not obliged to justify or condemn the different lines of expenditure that are deemed by the leading nations to be wise or expedient.²

¹ Cf. Cohn, *Finanzwissenschaft*, p. 183.

² Another strong objection to entering into a discussion of the advisability of the different lines of expenditure, has been mentioned above in the paragraph showing that Public Finance should be studied as a science and not as an art. If we discuss whether certain expenditures ought to be made, or should be enlarged, or curtailed, we are leaving the safe scientific ground of what is or will be. The danger of thus falling from the high plane of scientific impartiality to the level of political wrangling is frequently illustrated by the work of Leroy-Beaulieu. Bastable's work, although saved from anything like a similar failure by the author's masterly ability to defend his position, is yet certainly marred by too frequent judgments concerning the advisability of existing features of fiscal practice.

Financial Administration is properly regarded as the fourth division of the subject, because it is as necessary to know *how* a State gets its revenues as to know *whence* it gets them and *for what* it spends them. This department, too, deals with a large number of technical details which would only cumber the other parts if taken up in connection with them.

Of the four divisions, Public Revenue is necessarily the largest: probably for reasons akin to those that influenced previous English writers to give taxation their exclusive attention. It is here that the most urgent reforms belong, and hence the need of understanding existing conditions is most pressing.

The distribution of the various financial activities among the different divisions of the government, federal, national, or local, will be noted in connection with the discussion of each part of the subject.

SEC. 4. The continued lack of any systematic treatise on the subject has left classification in a most chaotic state. From the point of view of form, merely, this is the most serious defect in Bastable's pioneer treatise on the subject. It lacks uniformity in the methods of classification. In the present work the attempt has been made to use the same method of classification from beginning to end. It is that suggested by Professor Cohn for all public charges, and afterwards developed in a somewhat different

Needed reforms make Public Revenue the most important part.

Uniform method of classification for all parts of the subject.

way by Professor Seligman.¹ The charges made by the government upon individuals vary in character according as the special benefit conferred upon the individual is made the exact or the partial measure of, or is not allowed to affect at all, the burden imposed upon him. Public Revenues and Public Debts have already been classified in this way, and it is very easy to classify Public Expenditure and Administration in the same way.

The nature of this classification and its applicability to the whole subject may be explained by reference to the well-known customs of our large athletic clubs. For membership, and the usual privileges of the club, each member is assessed the same sum, irrespective of the actual extent to which he uses the club, and without reference to his ability to pay, that being assumed for this purpose to be equal to that of every other member, and certainly without reference to any known ability to pay more. This fee is justified by the common benefit conferred. If, however, the member makes use of the dining-room, or asks for special privileges such as the private use of the club quarters, grounds, boats, appliances, etc., he pays an additional sum, measured, generally speaking, by the special benefit con-

The nature of this classification illustrated by the practice of athletic clubs.

¹ Cohn, *Finanzwissenschaft*, pp. 104-118, esp. pp. 117, 118; Seligman, *Quarterly Journal of Economics*, May, 1892 and 1895. Hints of the same classifications are found in Malchus and Hoffman.

ferred upon him. Again, if the club is in debt, or proposes to enlarge its facilities, not infrequently a subscription paper is passed around and each member is urged to contribute, not the same amount all others have subscribed, nor yet in proportion to the use he makes of the club, but "as much as he is able." And lastly, there are not infrequently cases where poor but promising athletes have been admitted, in order that the club may have the glory of their prowess, and have been excused from dues.

Now there is an almost perfect analogy between such a club and the State in respect to the contributions demanded, the benefits conferred, and the method of operation. Generally speaking, the State endeavours, in collecting revenues, to impose an equal¹ burden upon all for the support of those functions that are regarded as conferring a common benefit, and a special burden for the support of those activities which confer a special benefit, and under certain circumstances to increase the burden imposed upon the very wealthy, who are regarded as able to bear more; and lastly, to tax all for the support of the poor. Not that the State always succeeds in its endeavour, nor that all States recognise equally the desirability of the attempt; for in Public Finance expediency necessarily plays a large part. But most States have come to recognise more or less clearly these ideals, and their policy can be conveniently summarised in this way.

¹ What is meant by "equal" will be discussed later,

The various activities of the State can be easily classified, according to the degree of common or special benefit they are supposed to confer upon the citizens, or tax-payers. The various groups shade into one another, of course. But the extremes are perfectly clear and fundamentally different. Thus, it is universally admitted that the functions of the general administrative and legislative departments are of such a character as to give a common benefit, for which, ideally, every one should pay according to some scheme of supposed equality. But at the other extreme there are many things done by the State which confer so special a benefit as to justify a special charge. For example, when the State carries a passenger or a box of freight over its railroad, or carries a letter, or provides the citizens with china or tobacco, it confers a special benefit. Between these two extremes there are any number of grades, according as the predominant thought is that of common or special benefit, when both ideas are present. But there is one more consideration that must be introduced. There are a certain number of State activities which it is in the interest of the whole to have performed, but which accrue to the special benefit of certain classes, who on account of poverty are unable to pay for that benefit; and if the State is to perform these functions, it must call upon the other classes for assistance, excusing the poorer. Theoretically, the support of the poor

State activities confer common benefit or special benefit.

and defective classes is an activity conferring a common benefit upon all the other members of society, and hence they are called upon to contribute accordingly. If we consider it the moral duty of society as a whole to help the weak, then the relief of the poor confers a common benefit. It is the same if we look upon poor relief from a less altruistic point of view, and consider that society is merely protecting its own interest, as, for example, in isolating the feeble-minded, so that they shall not propagate their weakness. Without going farther into details, which will receive attention later in the book, it is now clear that this method provides a feasible way of classifying public activities and public revenues. When we once have a satisfactory classification of revenues, it is easy to classify debts, inasmuch as they rest upon the revenues. The administrative features of the financial bureaux will fall naturally into place also.

A single method of classification, therefore, will pervade the work from beginning to end. The classification will help us to get at the economic features of expenditure, reveal the justification and measure of taxation, and show us the essential character of each kind of public debt; namely, the kind of credit upon which it is based.

It must not be understood that the assignment of any activity to a particular group is permanent. Activities that were once regarded as conferring

special benefit — as, for example, a large part of the administration of justice — come in time to be regarded as of common benefit. Such changes often proceed with rapidity, and the stages are not passed through synchronously by all States.

There are, for example, many cities which let private individuals provide the water supply. Others provide it themselves, on precisely the same terms as individuals would, while others provide it much as they do other special privileges,

The attitude toward public activities changes. A general movement toward the idea of common benefit.

regarded as conferring both special and common benefits; and very probably the time is near when most large cities will regard it quite as much a matter of common benefit to provide each and every citizen with at least a certain amount of water at the cost of the general taxes, as they now regard it a matter of common benefit to dispose of the sewage, a function which was once considered the duty of each citizen, and is still so regarded in many cities. But however mutable our classes may be, they are clearly discernible, and it is generally only by slow degrees that we find cities proceeding from one end to the other of the systematic grouping.

While there seem to be general tendencies, which transfer all activities from the special benefit to the common benefit plan, there are a few exceptional cases where the movement is the other way. The support

Some activities cease to be regarded as of common benefit.

of religion is such an instance. Originally almost

the sole object of State expenditure, this has now, after passing through various ups and downs, come to be regarded as of such special benefit that it is being gradually excluded from the sphere of the State, and left to private support.

PART I

PUBLIC EXPENDITURE

CHAPTER I

THE NATURE OF THE STATE, ITS FUNCTIONS AND THEIR CLASSIFICATION

SECTION 1. The STATE is the centre of Public Finance. The State requires money and services for the performance of its functions. The first question is what is the nature of the State, and what are its functions? To answer this we shall have to borrow a little from Political Science. The best recent authorities on Political Science seem to answer the question, "What is the State?" with a more or less expanded but not essentially modified restatement of Aristotle's famous dictum: "It is manifest that the State is one of the things that exist by nature, and that man is by nature a political animal." The State is an organism into which the individual is born, and through which alone he can hope to reach his highest development. Upon its existence, and the perfection with which it performs its functions, depends the degree

of social organisation possible. The State seems to be God-given to enable society to organise on a grand scale for the accomplishment of practical ends far beyond the reach of the individual, — ends upon which the welfare of the individual depends.¹

The two opposing theories as to the proper sphere of the State, Individualism and Socialism, stand for two grand truths. The one for the truth that the individual, if he is to accomplish his manifest destiny, must be allowed or assured room enough for the free exercise of his powers so as to develop them, and to expand. Such individual development is necessary for the advance of society. The second, that the State affords the individual the surest means of obtaining the assistance of his fellows, so necessary to his own complete manhood. The way of reconciling these two theories is pointed out in the Christian doctrine that true freedom consists in perfect obedience to the law. Anything short of perfect obedience to the highest law is failure to attain the highest freedom.

The constant intrusion of the State on fields of activity previously given to the individual is a natural result of the constant increase in the separation of employments, necessitating more extensive organisation. As the individual becomes more and more depend-

¹ Cf. Kidd, *Social Evolution* ; for detailed analysis of the nature of important modern states see Burgess, *Political Science and Comparative Constitutional Law*.

ent for the completeness of his own life on his fellows and their faithful performance of the duties assigned to them, the organisation of the State becomes correspondingly more perfect. As regards this increasing importance of organisation, the following will fairly summarise the practice of advanced nations. It is impossible to approve on *a priori* grounds of every intrusion of the State into fields hitherto set aside for the individual. Only when such intrusion does not lessen individual power, energy, ambition, and ability to advance, is it permitted. And only when it promises definitely to increase the importance of the individual, in the long run, is it desirable. The burden of proof is therefore in each concrete case thrown upon the persons who would have the State advance into new fields. There is no absolute limit to, but only a general presumption against, the assumption of new functions by the State.

SEC. 2. If Political Science cannot in the nature of things give us any definite, theoretical limits to the expansion or the contraction of State functions, can such limits be found in Public Finance? If the common statement that "the State regulates its income by its expenditure and not its expenditure by its income" is altogether true, there can be no limit set by Public Finance to the possible expansion of State functions. But there are

Does Public Finance set any limit to the possible expansion of State activities?

as a matter of fact many important exceptions recog-

nised.¹ Those exceptions are : (1) that statesmen in deciding as to the advisability of any new expenditure necessarily consider the amount of burden it will impose on the tax-payers. The expansion of municipal activities in the last twenty-five years has been so rapid that at present any further expansion is, in many instances, at least temporarily checked by the difficulties in the way of meeting the cost. (2) There are some instances where for political reasons income has outrun what was regarded as wise expenditure and new ways of spending have had to be devised. This is a decidedly more unfortunate state of affairs than the other, for such forced expenditure seldom takes a wise direction. Witness the wholesale plundering of the United States treasury for pensions. (3) Expenditures may sometimes rise very rapidly, and necessarily so, at a time when it would be extremely unwise to attempt to increase the revenues. At such times the practice of nations, — a practice that has proven itself wise, — has been to let expenditure run beyond the income and borrow the difference.

One of the prime requisites of a good system of public revenues is that the sums taken from the
A limit set by the requisite of steadiness in revenues. people each year in the various ways shall be as steady as possible. The reason for this will be made clear under the general consideration of revenue. That fact, however, forbids our determining the annual reve-

¹ Cf. Bastable, p. 42; Wagner, I., sec. 11.

nues absolutely by the annual expenditures. The general practice of nations is to increase expenditure, (*a*) when it is absolutely necessary, (*b*) if not absolutely necessary, when it offers advantages which more than compensate for the increased burden on the revenues. The experience of nations has also shown that it is universally better to do the public business, if expenses are increasing rapidly, on a deficit rather than on a surplus. If expenses are for a considerable period quite uniform, the usual policy is to keep the revenues, as nearly as possible, equal to them, but not in excess of them, and when expenses can for some reason be lessened, some of the revenues may be applied to the amortisation of accumulated deficits. It would seem, then, that steadiness of revenue is treated as the more important consideration. Herein lies a limit, but not an absolutely fixed one, to the expansion of expenditure and of State functions.

*Practice of
nations recog-
nises a limit.*

To sum up: the general character of public expenditure, especially as to whether imperative or not, as well as to its particular direction, will depend primarily upon considerations which belong to Political Science. Its amount will depend on the revenue-yielding strength of the State, and upon the effect which such expenditure will have thereon. The danger made so much of by some writers¹ lest,

the argument
as to the limi-
tation of state
functions.*

¹ Roscher, sec. 109.

revenues being obtainable by compulsion, that compulsion be exercised for the benefit of interested persons, who gain particularly by the increased spending, is in a democracy replaced by the corresponding danger lest too meagre supplies be granted by the voters who must themselves pay the larger part of the revenues, and advisable or even necessary lines of expenditure be omitted or seriously curtailed.

SEC. 3. Expenditure, like every other feature of Public Finance, changed radically in character and direction during the eighteenth century. Therefore, before proceeding to analyse present expenditure, we shall do well to take a brief survey of expenditure before this century. In the early stages of State life the forms of property were few, public life was identified with the family and with religious life.

Public expenditure in early times. There was little call for definite public expenditure. The chief item was for religious observances, and for these purposes only was there a distinct public treasury. Foundations for the support of religious observances, as seen in Greece and Rome, are extremely old. The temples have their own groves, lands, mines, and flocks, receive contributions, and exact a tariff for their services. Materials for the study of this period are scant. Services of a public character are performed by all citizens as a matter of course. In war they are the warriors, they furnish their own arms. Their reward is in the success of

their enterprise. By mutual effort, or the slave labour of conquered peoples, they build their fortress-cities, ships, roads, and temples. The simplicity of economic life forbids the rise of any proper system of public revenues. Taxes are levied on conquered peoples, but the free citizen is exempt. There is practically no division of labour in State matters which would call for a paid public service. Greece and Rome emerge from these primitive forms with a more complicated system of expenditure, but with relatively little advance in revenues.

SEC. 4. In Athens we find a highly developed system of expenditures, almost communistic in character, and greater than that of other *Athenian ex-*penditures of Greece on account of the *penditure*.

sources upon which the city treasury might draw and the peculiar circumstances in which the city was placed.¹ The expenditure for public buildings and public works was particularly large, as were the extravagances of public festivals and sacrifices, of donations to the people, compensations for attending the assemblies, and the like. Peculiar to Athens, among all the nations of that era, was the assistance rendered at the public expense to the poor and especially to the children of those fallen in war. Regular expenditures are said to have varied from 400 to 1000 talents, or from \$410,400 to \$1,026,000. Extraordinary expenses in time of

¹ The outline in the text is necessarily very brief; for a longer account see Boeckh, *The Public Economy of the Athenians*.

war were relatively small on account of the rendition of voluntary services by the citizens.

In Rome there was no distinct public budget in the earlier days of the republic.¹ The public wealth was not distinct from the private wealth of the citizens. With the increase of the provinces and the receipt of tribute from them came regular methods of public expenditure. The items directly borne by the State were the cost of the priesthood, of buildings and other structures and roads, of the army, of the general administration, and of the distributions of food, grain for the city population, donations of money, oil, and wine. The army was first paid in 406 B.C. But for a long time afterward the remuneration amounted to little more than the reimbursement of expenses. At first the Emperor was supposed to live from his own private property, but as he had control of all the public revenues, the distinction was difficult to maintain. The later courts were extremely extravagant.

Greek, and especially Roman, expenditure had many features similar to modern expenditure. In classic civilisation, division of labour was sufficiently developed to render possible the payment of those who devoted all their time and energy to public affairs. But continuity of development is lacking. From the fall of Rome to the rise of feudalism

*Division of
labour and
public expenditure.*

¹ See Marquardt, *Römische Staatsverwaltung*, Bd. II.

there is a reversion to the earlier forms of public life. Public expenditure is not separable from private. The citizen serves the State without remuneration, and there are no public expenses proper.

SEC. 5. It is the essence of feudalism that all governmental functions are placed in the hands of officials who are given the possession of lands which yield the necessary revenues for the execution of those duties. At the same time the relation between these rulers and the people is such that services can be commanded for public purposes without distinct remuneration. The undeveloped condition of commerce and industry necessitates that public contributions shall be in products and in *Feudal ex-* services. The chief duties of a public *penditure.* character that are performed by these semi-public officials are the organisation and leadership of military operations and the crude administration of justice. Of administrative functions in our modern sense there are scarcely any. The public funds are so entirely under the control of the prince that he comes to regard them as his own. At the same time the various subordinate lords, who were originally officers of the crown and who received lands for the purpose of supporting them in their offices, succeed in retaining possession of the lands and other rights and privileges, although neglecting the duties for which they were given. As the monarchical State emerges from feudalism there is the same complete identification of the public purse with the

private purse of the monarch, as there was of the State with the person of the monarch. And this, too, although a good share of the revenues are now derived from taxation. Expenditure is for the gratification of the prince, and so far as he sees that his interest is the same as that of his people he spends for them.

The advance of constitutional forms of government is everywhere characterised by constant successful attempts on the part of the representatives of the people, or of those who contribute to the public purse to get control of the finances. Constitutionalism advances just as fast as it succeeds in this attempt. At present the control of the purse is entirely in the hands of the constitutional legislative bodies in almost all countries, and the domains of the prince, which were originally given him by the people in order that he might be supported in proper dignity in the performance of his public duties, and were then diverted by him to his private enjoyment, have been regained by those who gave them, and are in most States once more public property. The expenditure for the support of the crown now becomes one of the chief items on the civil list. The final establishment of constitutional government has introduced a new criterion for judging public expenditure. An expenditure is no longer a justifiable one when it gratifies the whim of the ruler or of the governing body, but it must result in

some clear benefit to the people as a whole, or to the nation, or in a benefit that is so regarded; otherwise it will not continuously meet with the popular approval which is now necessary to sanction every governmental action.

SEC. 6. Many attempts have been made to classify public expenditures, and often with good results. The most common are those which follow more or less closely the usual economic analysis of private expenditure, according as the wants satisfied are necessary, desirable, or superfluous. The use of economic terms in this way is to be commended, but as in Economics, so

*Necessary,
desirable, or
superfluous
expenditure.*

here, the vagueness and relativity of these terms are very unsatisfactory. Different writers do not agree as to what are necessities, even for the same State. After all, the assignment of any particular expenditure to one or the other of these categories is merely the expression of the author's individual judgment on the expenditure in question.¹ This savours too much of the art of Public Finance for a scientist. Professor Bastable, after pointing out this very difficulty, proceeds to make a classification based on the order of historical rise of the different functions, or perhaps it would more nearly reproduce his thought to say that he tries to establish historically a sort of natural evolution or sequence of public expenditures. The difficulties he encounters, in the search for such

¹ Cf. Bastable, p. 43.

a sequence, are so great that the results are not particularly clear and not at all convincing. The difficulties arise from the fact that such a process merely substitutes for the author's judgment, on which the older classifications rest, the judgment of the leaders of national policy at different times and in different places on the same questions ; namely, are these expenses necessary or merely expedient ? He certainly gains much by substituting the point of view of past statesmen for that of any present person or persons. But it will be a still greater gain if we can eliminate the personal element entirely and make a classification that does not depend upon the way in which the desirability or undesirability of the different functions is regarded. The important thing in Public Finance is not to ascertain whether or no certain functions are to be approved.

Such an analysis as we are in search of has been suggested by Professor Cohn,¹ which he has well called the "economic analysis of civic housekeeping." There are according to this suggestion four groups. The first consists of those functions which confer so definite a benefit upon the individual, and are so clearly performed solely for the benefit of the individual, that he would naturally be expected to meet the cost of them. The second group consists of those functions which confer a common benefit upon all members of the State, of such a character that it cannot be par-

¹ *Finanzwissenschaft*, p. 117.

celled out and each portion definitely assigned to the respective members. This group embraces the prime functions of the fundamental institutions of the State. These are the two extremes. Between them are two more groups. The third consists of those functions which confer a special benefit that might be separately assigned to particular persons, but in which such assignment is wholly or partly waived, because there is also sufficient common benefit to justify making such functions a total or partial charge on the general ability. Finally, a fourth group, which consists of those functions that confer a special benefit on certain individuals more or less unable to assist in bearing the charges, and which are consequently treated as though they conferred a common benefit upon all the members of society.

Dropping, for the present, all consideration of the ways in which the benefit is measured, which will be fully discussed under the head of revenue, and rearranging the groups in the order of their importance, we have the following four classes of expenditures :

*The four
classes of ex-
penditures
according to
the benefit con-
ferred.*

First, the largest and most important, those which confer a common benefit on all citizens.

Second, those which confer a special benefit on certain classes that is treated as a common benefit, because of the incapacity of these classes.

Third, those which confer both a special benefit

on certain persons and a common benefit on all the others.

Fourth, those which confer only a special benefit on individuals.

Under the first of these come the general expenditures for the support of the constitutional agencies of the government. The support of the administrative and legislative departments, in almost all their branches, including the diplomatic corps, and everything necessary thereto, as public buildings, etc. Here, too, belong the support of defence and the maintenance of internal security and quiet. Here belong, according to modern practice, the maintenance of roads, although it was once treated as belonging to class four, and passed through a transition stage in class three. Under this class belong, also, the chief expenses in connection with the maintenance of the money circulation, although a part of this expenditure is in most countries to be assigned to class three.¹ The same is to be said of the expenditure for education. Here belong the administrative control and assistance of private industry and commerce.

Under class two belong the care of the poor and the defective. Also the support of the pensioned, unless pensions are such that they may be regarded as unpaid wages, in which case they belong to the first class.

¹ The United States once charged a seigniorage of $\frac{1}{2}$ per cent.

Under class three come the administration of justice, the provision for religion wherever the State has an established church, the general administration of the postal service (sometimes, however, this is in class four), the administration of special rights, like patent rights, copyrights, corporation privileges, etc.; also, the recording of titles, etc., the laying out and grading of streets, building of sewers, etc.; so, also, the water supply in many cities, although the provision for this is rapidly undergoing a development that will eventually place it in class one.

To class four belong almost all of the great industries carried on by the State or by cities, the monopolies maintained by them for their own benefit, etc.

As will be seen from remarks made above in connection with the assignment of certain of these services to the different classes, there has been, and still continues, a certain process of evolution which may be generally summed up as a tendency for all these expenditures to move from class four to class one. There are many instances where expenditures now regarded as naturally and unchangeably belonging to class one were regarded as belonging to class four. When a government assumes any new industrial function, as, for example, supplying water to the inhabitants of a city, that function is first assigned to class four and treated as though conferring a special benefit only. But it frequently

comes about that it is regarded as a function conferring a common benefit at least in part, and passes into class three. There are forces at work which seem likely to place it finally in class one. In the case of highways this transition has been completely made, and, except in the case of city streets, which still belong to class three so far as construction is concerned, but pass into class one as soon as finished, highways are treated as conferring common benefit only.

In the following chapters on expenditure the order indicated above will be followed. The arrangement of the different expenditures under class one will be somewhat according to historical origin and importance.

CHAPTER II

EXPENDITURE EXCLUSIVELY FOR THE COMMON
BENEFIT

SECTION 1. IN this chapter we will consider expenditure of the first class; that is, expenditure so clearly for the good of all that no special charge is made upon any of the individuals incidentally benefited. From one point of view *Net expenditure.* expenditure of the second class, wholly for the benefit of certain persons, who are, however, exempt from any special payments, the expense being treated as involving only common benefit, is sufficiently like that of class one to come under the heading of this chapter. But it has been made a part of the next chapter in order not to lengthen this one unduly. Both of these expenditures might well be called net expenditures in distinction from those which, unlike them, result in some accompanying revenues.

The first item is that for general administration. Administrative expenditure is for the support of those officers of the government who have to do with civil affairs. For convenience it is best to limit it to those officers whose functions are absolutely indispensable to the execution of the laws. *Administrative expenditure, the civil list.* The officers who will

be included vary, from country to country, with the frame of the government. It has been customary for financial writers, following the lead of the Cameralists, to limit their discussion of this expenditure to that for the crown and court. This is, in England, called the civil list. The peculiar character of such expenditure in monarchical countries makes it advisable to isolate it. But it must be borne in mind that in republican countries there is no corresponding expenditure. The salaries of the highest executive officials in republics are of the same character as those of the ministerial officials in monarchies. In England the civil list for Her Majesty's privy purse, household, charities, etc., amounts to £407,629, and if we add the annuities paid to members of the royal family amounting to £173,000, the crown may be said to cost Great Britain nearly \$3,000,000 per annum. In most monarchical countries, these expenses were originally met by the revenues from the crown estates. But these revenues from the domains, having been absorbed by the general treasury, it became necessary to make provision for the civil list from the general revenues. To the civil list should be added the salaries and other expenses of the ministries, their clerks, secretaries, etc. In federal governments the administrative departments of the component parts or commonwealths, as well as that of the central government, should be included. Finally there come the administrative departments of the local governments. It is very difficult to ascertain

the number of such officials and almost impossible to ascertain all such expenses. According to the summary in the eleventh census the cost of all the executive departments of the United States was \$16,770,801 in 1890. This does not, in all probability, cover more than half the cost of all that should be included.

In monarchical governments, and to a certain extent, also, in republican governments, traditional sentiment demands that the head of the government shall hold a social position of great prominence and perform certain merely ornamental functions, involving considerable expenditure. So that the expenditure for the services of the highest officials is generally larger than the sums which would be necessary to obtain merely efficient service. This lavish expenditure may be fully justified on political grounds, but as it involves great waste, both directly and indirectly, by example, it cannot be justified on economic or fiscal grounds.¹ It is a general fiscal principle, applicable as well to this part of expenditure as to any other, that the expenditure should not be larger than is necessary to secure the most efficient service. The justification of this lavishness, therefore, must be found, if anywhere, in the creation of some equal utility recognised by Political Science. The exceptions made in practice to the general rule of economy do not extend beyond the heads of the admin-

*Expenditure
on the civil list
largely orna-
mental.*

¹ Rau, *Finanzwissenschaft*, sec. 48.

istrative departments. In the subordinate positions the remuneration does not generally exceed that *Saving in the lower branches of the administration.* which must be paid for similar services in private life. Indeed, there is a certain saving, in that many of the positions, especially where the tenure of office is secure for a relatively long period, can be filled at a lower cost than the same services command elsewhere, on account of the honour attaching to them. In those countries where the expenditure for the higher positions is largest much is saved by the lower pay attaching to subordinate positions.

In this connection, mention may be made of the diplomatic and consular service, which, while partly *Diplomatic and consular service.* conducive to the better performance of other functions, as, for example, defence and the regulation of commerce, is yet properly considered to be subordinate to the executive departments. Here again the traditional opinion that the dignity of the nation can only be properly sustained by a lavish expenditure on the part of the ambassador or minister, imposes on the treasury burdens far greater than the value of the services rendered, if measured by the ordinary business standards. As the means of communication improve and the general efficiency and reliability of the news agencies of the public press grow, it becomes harder and harder to justify this extravagance even on political grounds. The custom of lavish expenditure for diplomatic services has not

been carried to such extremes by the United States as by other countries. As these positions are more or less of the nature of political prizes, in that country, this has probably been to the improvement of the service. Foreign intercourse cost the United States \$1,583,118, in 1894, while Great Britain paid £531,392, or \$2,656,960, for that service, not including colonial services of practically the same character, which would bring the amount up to over £900,000. Generally speaking, the executive department costs comparatively little outside of the actual salaries. There are some election and similar incidental expenses, but not many.

To the administrative department belongs the expenditure for the collection of the revenues. Although this is a part of the gross expenditures only, it is properly included in the general accounts so as to render control possible. England spends on the collection of the customs duties £871,915, on that of the inland revenues £1,814,039, on the post-office gains £7,037,785; the cost of collecting the total revenues of £100,660,881 is £13,249,293, or about thirteen per cent. This seems an extraordinarily large deduction, but the amount is large because of the large amount of expenses connected with the relatively small returns of the post office and the deficits of the telegraph and some other services. The cost of collecting customs is only about four per cent, of collecting the inland revenues about three per cent.

*The cost of
collecting the
revenues.*

In the United States the cost of collecting the customs duties was about three per cent in 1893, and five per cent in 1894. The receipts fell off in that period from \$200,000,000 to \$130,000,000, but the expenses did not fall off correspondingly. The cost of collecting the internal revenues in 1893 was about two and one half per cent, in 1894 it was about three per cent.

SEC. 2. The expenditure involved in the payment of salaries to legislative officers, when any such are paid, is not the largest part of the expenses caused by the maintenance of such bodies. There are the clerks, aides, pages, etc., in immediate attendance upon the bodies during their session, the expenses of elections, which in this case swell to considerable amounts, the costs of investigations, public hearings, etc., necessary to put the legislature in possession of the facts upon which to base their actions, and the expenses of promulgating laws, publishing speeches, reports, etc., all of which together form no inconsiderable burden on the finances of every nation enjoying legislative government. These expenses, also, extend from the federal government down to the municipal governments. The desirableness or undesirableness of paying legislative officers for their services is a matter for Political Science to determine, and depends in large measure upon the traditions of the different peoples. In England relatively little is spent in this way in any of the

*The expense
of the legisla-
tive depart-
ment.*

legislative departments of the government from Parliament down to the parish. But in that country there is a tradition of unpaid public service that gives her much help in this direction. In the United States the direct emoluments and other legitimate expenses of the Federal Congress, and the direct and indirect, more or less illegal, raids by the commonwealth legislatures on the treasuries, as well as those made by the city councillors and aldermen, are very large. It has been estimated by Mr. Moffett¹ that in the 52d Congress of the United States it cost \$4,593,922.60

*The cost of
Congress.*

to maintain the House of Representatives alone, exclusive of election expenses, or about \$6285 a day for each day of its existence including Sundays and holidays. Of this amount \$3,320,000 went for salaries. There were, therefore, \$1,180,000 spent on travelling expenses, clerks, subordinate house officials, and contingent expenses (including about \$100,000 for stationery and newspapers). But this is by no means all. The expenses traceable mainly to this source in the reports of the auditors, of which public printing for Congress is an important item, foot up to about \$7,000,000 per annum, or for the two years of the life of a Congress \$14,000,000. The real cost of the federal legislature to the country is even larger than that, but the items are not easily traceable in the reports, and some of them, like election expenses, are not reported. Directly

¹ *Suggestions on Government*, p. 150.

traceable to the legislative departments of both the federal and commonwealth governments were, in 1890, \$10,500,000. The only expenses directly attributable to this source in England are for the officers of the House of Lords £41,595, for the officers of the House of Commons £52,133; total £93,728. But many expenses attributed to the different departments should be included. The fact that the ministry is at the same time executive and legislative causes a different distribution of the cost, and it is impossible to arrive at an estimate even as accurate as in the case of the United States. England does not print public documents for free distribution, so that the expense for stationery and printing is less than half that of the United States, being a little over £500,000.

Some mention should also be made of the expenses involved in the support of local or semi-local legislative bodies. For the United States, there are the State legislatures and the city councils, and, for England, the local government board and the county and municipal councils. Of these, only the commonwealth legislatures are purely legislative in character. The others perform functions which are better described as administrative. It is so difficult to obtain a correct estimate of the particular expenses for the support of these subordinate bodies as to be an unprofitable task. These bodies, too, are so intimately concerned in the administration of the other functions that we

gain little by isolating the mere expenses of their maintenance. With the commonwealth legislatures, however, the matter is different. These are purely legislative. In most commonwealths the legislatures are paid *per diem*, and they are prevented from running up too large bills by the limitation of their term. The *per diem* remuneration and mileage are fixed by law, and range from \$5 to \$10 a day and from five cents to ten cents per mile. A loophole for additional expense is left by the necessity of allowing the legislature to appropriate money for incidental expenses. In some commonwealths, as for example in California, this power is abused to such an extent that the contingent expenses amount to much more than the mileage, regular clerk hire, etc., combined. Money is spent for the hire of personal attendants on members, stenographers, clerks, etc., for tours of inspection to various institutions, and the like. Most of this expenditure contravenes the rule of economy. England in the absence of the federal system is spared this expense.

SEC. 3. The construction and maintenance of public buildings for the convenience of the executive and legislative departments and for other purposes is one of the most important although not one of the largest items of expenditure. The construction of such buildings is of course necessary. That they should be imposing edifices, handsomely decorated and equipped, is a

matter of national pride. That their construction should not be wasteful is self-evident. The extravagances and theft which have too often accompanied the construction of such buildings in the United States are too well known to need discussion. They are purely abuses and need no farther words of condemnation than they have always received. The cost of construction may be regarded as a permanent investment, not yielding a money revenue, but far greater utilities. The federal government spends annually about \$3,500,000 upon public buildings. From 1789 down to 1882 it spent \$85,591,590 for the same purpose, or an average of about \$900,000 per annum. In 1890, all the different branches of the government together in the United States spent \$56,841,147 upon public buildings. The British government spent, in 1894, £1,750,000 on the special account of public buildings, but there are a good many similar expenses included in the other supply services.

The exact annual value of these utilities to the government cannot be directly estimated in money.

The value of public buildings. Indirectly it might be estimated as the equivalent of the interest on the sums which it would cost to replace them in

the most economical manner, less the annual cost of the repairs. As, in most cases, the original expenditures were extravagant and wasteful, this method of computation would result in a smaller sum than the interest on the original cost.

SEC. 4. A nation differs from individuals in that no law can be imposed upon it by any external human power. The enforcement of the rights and obligations of nations in their intercourse with one another is left to the different nations themselves. As long as international law offers no peaceful means of redressing wrongs, war is the only recourse. "International law," says Woolsey, "assumes that there must be 'wars and fightings' among the nations." This assumption is universally correct. There are no signs, as yet, that nations will cease to consider that war, or at least the actual preparation therefor, as its sole preventive, is an absolute necessity. The whole theory of the independence and equality of sovereign States, upon which international law proceeds, throws the maintenance of national dignity, honour, and recognised national rights upon the nations themselves. The extent and character of preparation for war in each State depends upon its history, national character, and geographical situation. Thus, the warlike traditions, the mutual distrust, and contiguity of France and Germany, impel to extensive preparation for war, and similar considerations affect other nations of Europe. On the other hand, the traditions, national character, and geographical position of the United States have led to a feeling of security, and a preparation so insignificant compared to European armaments, as to call forth continual warnings and protests from

*The cost of
defence is un-
avoidable.*

military authorities. The necessity and probable continuance of this burden on the finances of nations being thus predetermined, the only task for the student of finance is to ascertain how great a burden this imposes on the treasuries and what possibility there is for some return.

There has been much discussion of the relative merits and economy of the different methods of army organisation. It is pointed out that the German system of compulsory service of all citizens without remuneration shows a much smaller cost, per man, than the English and American system of paid enlistment. But it is urged again that there are in Germany a larger number of expenses involved in the army system, than those of the government, as the personal expenditures of the soldiers, the cost to the country from the disturbance of production, the extra costs of enrolment, of free quarters during manœuvres, etc., which do not appear in the budget, but which should be counted in before any fair comparison can be made. It would seem that, in the end, the actual expenditure for this purpose could only be as much less, per man, as the standard of life of the soldier is less in the one country than in the other. And on this ground it might be urged that the German system, which gives the soldier but little spending money to waste, and by very strenuous measures inculcates thrift and almost penurious economy, was on the whole the cheaper.

Different systems of army organisation.

How much again this lessens the efficiency, per man, and necessitates a larger number of soldiers is hard to estimate. In England the volunteer system, while adding somewhat to the cost, does not make as heavy drains on the treasury as do the German reserves; but as the expenditure by the individual members of the volunteer service is for a public purpose, it is a part of the cost of the system, and a part that is very difficult to estimate. On the whole no accurate comparison is possible. The actual expenses of the different nations as they appear in the budgets are as follows: England 1894-1895, army £18,000,000, navy £18,700,000, together, £36,700,000. United States 1895, army \$54,500,000, navy \$31,700,000, total \$86,200,000, but this includes over \$16,000,000 for the construction of new vessels. Including the amounts spent by the commonwealths the total expenditure for military purposes and the navy were, in 1890, \$57,544,617. One of the main features of the American system is the establishment of training schools for officers, costing \$360,000 for the military and \$220,000 for the naval academy. In most countries this is a rapidly growing expenditure.

The expenses of actual war are not a part of the regular budget of modern nations. They are always treated as exceptional or extraordinary expenses. Besides the sums actually expended by the public treasury there are many indirect losses and expenses involved. According to the

The expense of war.

estimates of Wilson the cost of wars to England from 1688 to the present time was over £1,258,680,000. The cost to the United States of the Civil War is hard to estimate. The debt incurred amounted to \$1,845,900,000; \$800,000,000 of revenues were spent during the war; commonwealths and cities spent a part of their current revenues and rolled up debts, and the pensions will probably amount to over \$2,000,000,000. \$6,000,000,000 represents approximately the actual expenditure by all the governmental agencies on the side of the North.

The general preparation for internal peace and security and the prosecution or punishment of the *Internal peace and security.* disturbance of that security by individuals or small groups of persons is a very important item of expense. Such security is generally maintained by the police and the military. In the United States the chief expense is borne by the cities. The States and counties have their own police officers for this purpose, as do, also, towns not cities. The cost of the police for the whole of the United States was, in 1890, \$23,934,376.

SEC. 5. The building and maintenance of roads is a source of expenditure which well illustrates the general trend of development. Adam Smith regarded the maintenance of roads as an *The cost of roads, a common burden.* activity conferring so special a benefit on the individual user that he should bear the burden. Even Bastable places them among the "industries of the State."¹ But the universal ten-

¹ Pp. 193, 194.

dency is to make the maintenance of roads a common burden because conferring a common benefit. The care of the roads is generally a duty of the local governments, and in the United States the first taxes laid in the colonies were for this purpose. The Federal government stopped spending much for roads and canals after 1840. In the period from 1789–1882 the total expenditure was only \$19,966,465. In the year 1890 the commonwealths and local governments spent \$72,262,023 on roads, sewers, ditches, and bridges.

The maintenance of waterways, roadsteads, harbours, rivers, canals, is also a public function. Canals, to be sure, have passed or are *Public assistance to navigation.* passing through the same development as roads, and in some respects harbours and rivers have also done so.¹ In the United States the dredging and improvement of the facilities for navigation in rivers and harbours are the only important items of “internal improvement” that have been consistently held in the hands of the federal government. From 1789–1882 Congress spent \$106,882,717 on rivers and harbours, and in 1890, \$11,737,438 were spent thereon. In the same line is the maintenance of light-houses, signal-stations,

¹ Many of the harbour expenses of the port of San Francisco are treated as expenditure conferring a special benefit on ship-owners. But there is a movement on foot to throw more of these on the general revenues, on the ground that they confer a general benefit. See San Francisco daily papers November 9, 1895; also December 20, 1895.

the weather bureau, and life-saving stations. The latter is in some countries supported by private contributions; in the United States it costs \$1,250,000. The construction of light-houses, beacons, and buoys cost from 1789-1882, \$77,080,509. In 1894, the light-house service cost the United States \$3,250,000.

SEC. 6. No expenditure commends itself more than that for education. It creates the groundwork of all political institutions. No expenditure in the opinion of Geffcken is more "reproductive" than that which the State makes for the development of its future citizens. But the expenditure of the various countries for this purpose cannot very well be compared, because it is very difficult to obtain a complete statement of all the outgo under this head. The local governments generally have certain lower branches under their control and pay a part or the whole of the expense of those. In federal governments the remainder of the system is generally under the control of the component parts. The United States federal government has rendered assistance to the commonwealth and local schools by grants of land of unknown value, and by the collection and dissemination of information through a bureau of education, and in various other ways. In England the provision for education made by public authorities is generally less than in most other countries, the sole exception being the provision for technical education.

Until very recently this line of public activity has been regarded by that country as one conferring a special benefit and to be paid for in part by fees. But it is now pretty clearly the accepted policy of all modern nations to provide at least the primary education necessary for every citizen as *Elementary education treated as a common benefit.* a common benefit and to make it compulsory and free to all the recipients. In treatment, then, it is as much a benefit for the rich childless man that the sons of his poorer neighbour should be educated as that he should have the protection of the police in the enjoyment of his property, and he is made to pay on that principle. In regard to higher education as given in the secondary schools, and technical education, there is no such uniformity of practice. Education in the rudimentary mechanical arts is in fact becoming as important a need of *Technical education.* society as elementary education in the usual branches. As the pace of industry becomes more rapid and its organisation more perfect, the possibility of giving this sort of instruction by the old apprenticeship system vanishes. There is no place for the boy in the modern factory. Private initiative cannot be depended upon to supply the opportunity for this sort of education. The State has to do so if it is done at all. In this respect many of the English cities are far ahead of any American city.¹

¹ Shaw, *Municipal Government in Great Britain.*

Whether University education should be given the recipients free of charge at the common cost is, in practice also, an open question. Had *University education not yet treated as a common benefit.* not liberal private endowments been made for this purpose, it is probable that the question would long ago have been settled, and that this branch of education would have been treated as the primary was. University education, even though enjoyed by but a relatively small number of the citizens, is far more "reproductive" and far more beneficial to the State as a whole than even a widely diffused system of primary schools. It is quite as important, if not more important, to have highly trained leaders of public action and thought as it is to have a low degree of intelligence widely disseminated. The University as a centre for research alone is worth many times what it costs. In proportion to the benefits which it confers on the State it is, where run at the general cost, the least expensive part of the whole system. The provision made by many of the western commonwealths of the United States for the liberal endowments of Universities from the public funds has been without exception the most beneficial and economical expenditure they have made. In Germany, too, a large part of the expense is borne by the State. Closely related to education is the maintenance of museums, libraries, picture galleries, and scientific investigations. These comprise in most countries an important part of the

provision for education. The United Kingdom spends on all these educational works £9,783,469 from the general treasury, and a far larger amount from other sources. In the United States in 1890 the total public expenditure for education was \$145,583,115, which was by far the largest expenditure for any one purpose.

SEC. 7. Indirectly all public expenditure aids private industry and commerce. But there are many forms of direct aid, that are treated and regarded as conferring a common benefit on all alike although accruing to the good of certain persons. Bounties are sometimes offered for certain products. Enterprises of various kinds receive subventions. The so-called protective system involves an indirect expenditure of the people's money in the same way. The expense of maintaining the currency, of building and keeping up roads, canals, harbours, and the like is of the same character. So are many public buildings, as exchanges, markets, slaughter-houses, structures and grounds for public fairs and the like, and commissions and other organisations for disseminating knowledge concerning horticulture, agriculture, and various industries. The maintenance of a system of weights and measures, also, belongs here. Besides all those mentioned and some others which are generally treated as expenditures for the common benefit, there are a great many things which the State does for the benefit and assistance of industry and com-

*Assistance of
industry and
commerce.*

merce that are regarded as conferring special benefit and treated as such.

The administrative control of private industry and commerce has become a necessity on account of the growing power of modern organisations of capital. The necessity has been widely felt of controlling industrial monopolies, and we have numerous commissions for the regulation of railroads and the like. To this branch of expenditure belongs also the cost of the control exercised for the protection of the public health over the production and sale of foods. This is mainly an expenditure of the local governments, although it occasionally enters into that of the central government, especially in the case of imported foods. The cost of the enforcement of sanitary regulations of all sorts is another expenditure of the same character.

CHAPTER III

EXPENDITURE FOR THE BENEFIT OF INDIVIDUALS

SECTION 1. In this chapter we shall consider the remaining three classes of expenditure. These are not so very closely akin, but have one point of similarity; namely, that they are all for the particular benefit of individuals. The first, however, is not so treated by any nation, but is treated as though it were an expenditure for the benefit of all. The relief of indigence and the protection of society against the insane and the criminal, the care of the feeble-minded and otherwise defective classes, and the care of the sick are among the most costly and most discouraging features of public expenditure. In the United States the expenditure for pensions, charities, and gratuities amounted, in 1890, to \$146,895,671, or nearly a million dollars more than that for educational purposes and the common schools. Generally even after the State has done all that it can be induced to do there is still room for private effort in the same direction. The expenditure by private persons and societies for exactly the same purposes is even larger than that of the government. So that this is un-

doubtedly the heaviest of all public expenditures. The relief of poverty has generally received more attention in treatises on Political Economy than in works on Public Finance. But it belongs very properly to the latter science. It is generally a local, rather than a national, expenditure, but on account of its vast size and economic importance has often received the attention of the central authorities, and is in many cases, at least partly, under their control. There is almost no expenditure that fails so signally to accomplish anything like permanent results. As frequently administered, poor relief has aggravated the very evils it has been intended to relieve. The words of Malthus are still true: "We have lavished enormous sums on the poor, which we have every reason to believe have constantly tended to aggravate their misery."¹ Yet the expenditure is necessary, indeed imperative, and will be so as long as the present sentiments on the subject prevail, unless we can remove the causes. That this may be done by the extension of educational facilities, especially technical schools, is a frequent contention. The student of finance need not enter into the question of the causes nor of the cure of poverty. Indigence is there, and the State has assumed the duty of relieving it. The modern methods of relief are fast coming to be as economical and efficient as the conditions under which they are necessarily administered admit. Like war, this is a form of ex-

¹ *Essay*, p. 438.

penditure that shows little tangible result that can be measured in terms of money.

The general principle applied in the granting of continued assistance to the poor is that the cause of poverty to be relieved must be such *The principles governing the granting of assistance.* that it cannot be removed by the candidates for assistance. In other cases, only temporary assistance is rendered. Those who can help themselves are desired to do so. The four agencies which really work together toward the same end are the civil, the ecclesiastical, the associated, and the individual. These should all work harmoniously and should avoid duplication of work. The assisted persons should, so far as possible, be put under conditions which will enable them to help themselves to the limited extent that they are able. The repression of vagrancy and the punishment of wilful paupers, who are really able to support themselves but unwilling to do so, is left to the courts.

Although poor relief is mainly a local duty, Great Britain contributes £710,000 annually from the central treasury for "non-effective and charitable services"; of this over £500,000 are for pensions. In the United States in 1890 public charities alone (not including pensions) cost \$40,000,000; but this sum does not include the value of provisions, etc., raised on the poor-farms, or at the work-houses, of which no accurate estimate can be formed.

Very different from the older sort of poor relief

is the institution of old-age pensions on the insurance plan. Such institutions, for example, as the German, for compulsory insurance may be made self-supporting and in time promise to relieve the State of a part of the burden of poor relief. If indigence is to be relieved by the State at all, such expenditure must be regarded as conferring a common benefit on all.

Modern society supports the insane and criminal classes at public cost. In this way the greatest possible saving is made. Indeed, the cost need not be nearly as great as it is. To a large extent prisons can be made self-supporting. It is perfectly feasible by a proper division of the field between the different institutions to make the prisons, insane asylums, and the like entirely self-sustaining. Hard labour is frequently a part of the criminal's sentence, the less violent insane can be made to work, and something can be got, by proper supervision, from the feeble-minded and the paupers. By an exchange of products between the different institutions the necessary diversity can be obtained. There is little excuse for the too common uselessness of the labour imposed ; the tread-mill and oakum-picking of our older prison discipline ; the digging of unneeded ditches by the insane, etc. Exchange of products, too, avoids the danger of conflicts with the labour unions, which so often arise when a prison attempts to make a product for sale in the open market. This expenditure is very

*Insurance
against old
age.*

*Insane and
criminal
classes can be
made self-sup-
porting.*

closely related to the one for the maintenance of internal peace and security. The burden falls mainly upon the finances of the central organ, or, in a federal State, upon those of the component commonwealths. The policy of isolating the defective classes, the insane and criminal, the deaf and dumb, the feeble-minded, and the like is an economy for society as a whole, and if it can be made to prevent the propagation of these weaknesses, is far-sighted.

Hospitals for the sick are imperative needs in the case of infectious diseases; they are great blessings and very desirable from the standpoint of expediency in all cases. The opposi- *Hospitals.* tion so frequently manifested by private medical practitioners to public hospitals is a sufficient proof of their economy. Generally this is a local expenditure. Certain branches of the government, like the military and the naval, have generally found it necessary, on account of the large number of persons in their employ, to make provision by hospitals for the care of their own sick. The maintenance of quarantine stations for the isolation of persons coming from infected countries or districts is a national affair. Its cost may at times rise to a considerable amount. But there is no question as to its necessity and economy. In the United States there are arrangements for quarantine between the different States partly at the cost of the federal government and partly at that of the commonwealths.

SEC. 2. Old-age pensions for officials whose lives have been spent in the public service, or for soldiers whose health has suffered, for the good
Pensions. of all, are but the proper recognition of those services. They may be regarded as sums reserved from the wages from year to year and paid over in this form. In that case this expenditure should be placed under class one. This is the case with most of the pensions in England, and there they are generally, correctly classed under the expenditure for the departments to which the men pensioned belonged before they retired. But when this expenditure becomes, as it has in too large measure in America, a means of reward for political services rendered to candidates for public office, it cannot be placed anywhere but in class two, being then an expenditure for the benefit of certain persons considered as though it were for the benefit of all. The rapid increase of expenditure for this purpose in the United States, as well as the curious features of that increase, show that it cannot all be justified by any rule of economy. In this country only soldiers are pensioned. Under general laws, which require only that there shall be sufficient proof that the applicant is entitled to a pension, all those who base their claims on inability to work or excellent services are pensioned. But many others are pensioned by special acts of Congress. The amount of pensions has increased since the Civil War, rapidly, but irregularly. The following table

shows the highest and the lowest points of each fluctuation :

1865	.	.	.	.	.	.	.	\$16,347,621
1869	.	.	.	.	.	.	.	28,476,621

Great Britain spends £535,454, on "superannuations and retired allowances," but special pensions for distinguished services, military and naval, civil and judicial, amount to £116,837, and some others are covered by the supplies for the different departments.

SEC. 3. Under this class belongs also that expenditure which is made for the development of industry by bounties and the protection of home industries against foreign competition. The lat-

¹ There are still nine widows of soldiers of the Revolutionary War on the list of pensioners. It is estimated that there is a possibility that some of these may survive until 1916. There are 45 survivors and 4445 widows of soldiers of the War of 1812. From Indian wars there are 3104 survivors and 3284 widows. From the Mexican War are 13,461 survivors and 7686 widows ; all the rest are attributable to the Civil War. Widows of soldiers who took part in that contest may still be on the pension list in the year 2002. — *World Almanac*, 1895.

ter expenditure differs from the former only in that the sums spent do not pass through the hands of the officers of the treasury. The recipients of this assistance collect it directly from the contrib-

Assistance to industry in the form of bounties and "protection." utors in the shape of higher prices for their wares than would otherwise prevail. With the economic side of this expenditure, and the possibility or im-

possibility of adding permanently to the wealth of a nation by this process, we have nothing to do. But as many important nations, all, in fact, except England, Norway, Holland, Belgium, Switzerland, and Denmark, practise this form of expenditure, we cannot avoid at least a statement of its character. The revenues derived by the government from taxes on the commodities actually imported will be considered in Part II. But so far as any actual "protection" is afforded the home producer it is an item of expenditure. In effect it is practically the same as if a subsidy or bounty were paid out of taxes collected from the consumers of the goods in question, to the producers. This expenditure is made not so much in the hope of increasing the total wealth of the nation directly as in the hope of obtaining a greater diversity of

Not begun as a permanent policy. products, so that in the end the effect will be to increase the wealth, indirectly, by allowing for a greater division of labour, and consequently for more steady and efficient production. This policy has nowhere

been begun as a permanent one, but one of its results is the growth of powerful vested interests which make for permanence. Thus bounties are paid directly from the treasury, or protection is afforded to industries which it is hoped will eventually be self-supporting but which are not so at the time. At different times circumstances have caused this policy to be supported by different arguments. Practically all the most important arguments have been used at different times in the United States, where protection has prevailed with scarcely a break from 1816 to 1895 and still prevails in large measure. The oldest of those arguments is known as the "infant industries argu- *Arguments by which protection has been supported.*" It is urged that new, weak industries cannot hope to live if subject to the competition of older foreign industries. At the same time it is maintained that in case of war it would be practically necessary for a country to be able to supply all its own needs. This grows directly into the argument of List, which is in the main to the effect that a nation's prosperity, in general, depends not so much upon the mass of wealth produced as upon the greatest possible diversity of its industries, so as to develop all possible phases of its national production. Just as the human body is healthier when all the muscles are uniformly developed, than when a few are abnormally strong, so, it is argued, a nation is more truly prosperous when all its productive forces are moderately active than when its en-

ture force is expended in a few lines. Later comes the patriotic or "home market" argument, which urges that the home producer has a claim on the custom of the home consumer. Finally this argument develops into the famous "pauper labour" argument, and it is maintained that the home producer has been enabled to pay his workmen higher wages than the same classes of workmen receive in foreign countries, on account of protection, and that to remove that protection would be to reduce the home workmen to the standard of life of the foreigners. This latter argument is largely an appeal to class interests for votes and is not quite tenable. The infant industries argument, it is generally admitted, is incontestable. The strongest argument in favour of the continuance of this subsidising of industries has been developed from that of List. This may be restated somewhat as follows: if the productive energy of a nation has but a few outlets, as in exploiting natural advantages, there is a great danger that the nation's economic life may become stagnant. If, however, production be diversified, even by an artificial process, it is much easier to keep the current of productive energy in motion, allowing it to be turned in whatever direction new advantages may open up.

While it may be admitted that there is great force in these arguments, it must be remembered that protection is very heavy expenditure, not less heavy because it is hard to estimate its amount. There

is a practical limit set to the possible amount of expenditure in this direction by the wealth of the people. If this process places too heavy a burden on the nation's annual wealth increment, the burden will not be borne, and the end defeated. That is, if the "protected" infant industries finally outgrow the need of subsidies, and fix prices by competition, the drain upon the resources of the country ceases. If they do not, the subsidising process may continue so long as the general mass of the wealth is not thereby too seriously curtailed. A nation may be able to pay for diversification of industries, just as it may be able to pay for schools, for parks, for museums, for libraries, etc. But the limit of such expenditure is set by what the nation can afford. This limit is too frequently overlooked; it is too often forgotten that all protection is public expenditure. No "protection" is afforded unless the price is raised. The difference between the price that would have prevailed and the price that does prevail is the amount the nation spends for this purpose. This is not offset by any gain in wealth, and can only be justified by the desirability of having a diversity of industries.

SEC. 4. We now come to those expenditures that are treated as conferring a benefit divided between the particular individual who pays for what he gets, and the people as a whole who pay in the general taxes for the general or common benefit. The first

and oldest of these is the expenditure for the courts. The adjudication of disputes between different persons was one of the earliest functions of government. The payment of the costs was originally thrown upon the suitors. But modern governments conceive that it is in the common interest to have justice universally administered. Upon the general and accurate administration of justice depends in great measure the prosperity of business. But either as a preventive of too frequent litigations or on account of the special benefit supposed to accrue to the suitor, the costs are divided, and one part paid by the people, the other — a minor part — by the suitor. In criminal cases the whole cost, practically, falls on the State; in civil cases the attempt is generally made to assess the cost upon the party at fault. In England, the cost of the judicial system is £3,787,167. A large part of the local administration of justice is rendered without emolument by the Justices of the Peace. The United States federal expenditure for this purpose is about \$7,000,000. The commonwealths, the counties, and the cities spend much more, making a total of over \$23,000,000. Besides the mere deciding of disputes and of criminal cases, the judicial departments perform other legal functions of importance, as, for example, the probating of wills, the disposing of property of intestates, etc. Somewhat similar legal functions are performed for the special benefit of the individual citizens by the

administrative branches of the government, as registration and legalising of deeds, mortgages, marriages, and other contracts, the granting and registration of copyrights, trademarks, patent rights, corporation rights, etc.

In the United States the courts have developed a number of legislative and administrative functions of great importance. As the interpreters of the federal and commonwealth constitutions, they have had to meet new conditions, and indicate the bearing of the constitutions thereon. They have often been called upon to interpret the meaning of constitutional customs that have grown up outside of the written documents, and have in this way given those customs a certain degree of legal prominence. They were formerly in some of the commonwealths (following an old English custom) allowed to determine the tax levy or apportionment. Quite recently, by the use of injunctions, they have exercised a sort of administrative control over industry, especially as affects the relations of employers and employees in industrial monopolies of public importance, as for example common carriers. In the control of municipal corporations, both by punishing illegal acts and compelling due compliance with discretionary duties, they have largely performed the functions exercised by the administrative departments in Europe.¹ In all this work they are considered as acting for the common benefit.

¹ See Goodnow, *Municipal Home Rule*.

SEC. 5. Other functions that are similarly treated need but to be enumerated. Among them are the laying out and grading of streets, building of sewers for the benefit of all the citizens, and the special *Betterment of* "betterment" of the property of abut-
property, etc. ting landowners. The division made here is generally that the first cost is assessed to the specially benefited persons, the subsequent costs, maintenance, etc., to the people. The supply of water is similarly treated in many cities. One of the best examples of this sort of expenditure is that of the post office, as managed in the United States. This service is almost, but not quite, entirely treated as conferring a special benefit on the users. The cost of the distribution of newspapers within the county in which they are published is treated as a public benefit. In some countries the post office is so managed as to yield a surplus, in which case it passes into class four.

SEC. 6. Expenditures of class four are part of the gross expenditure only. When a State spends money in wages and in the purchase of a plant and raw materials for the production of porcelain and the like, it expects to get it all back
State indus- again from the sale of the commodities.
try. The same is true of a city maintaining a gas plant, of a State railroad, etc. Originally, the State made use of public lands, forests, mines, etc., as a source of income, but now there are a great many industries and enterprises which the State conducts more

for a public purpose than for the gain to the public treasury. A city does not operate its street railways primarily as a source of income, but to guarantee the citizen good and cheap service. Hence the gross expenditure for this purpose is a very important item. It is growing to be more and more so as time goes on.

Some of the more important industries that the State carries on are for the purpose of supplying itself with certain commodities, as arms, *Manufacture* ammunition, war-ships, and the like. *of supplies.* Such industries are carried on from the highest branches of the government down to the lowest. We find, for example, many American towns supplying a part of the support of the inmates of its public institutions by cultivating the lands of the poor farms.

Some of the most striking instances of such industrial expenditure are connected with communication and transport, and with those industries the management of which, on account of the tendency to monopoly, is frequently put into public hands. Examples of this are numerous among those already mentioned. Many industries have been at different times and places so managed as to cost more than they brought in. That is, they have resulted in a net deficit, not a net profit. They thus pass into class three.

A rather significant list of enterprises has in modern times been entered upon by the State, which

might be, but are not, managed so as to yield a revenue that offsets their cost. These are museums, libraries, parks, baths, and the like. They belong under class one.

PART II

PUBLIC REVENUES

CHAPTER I

THE CHARACTER AND CLASSIFICATION OF PUBLIC REVENUES

SECTION 1. German writers on Public Finance generally begin the discussion of revenues with the statement that the State requires services and commodities. The services are furnished by the citizens ; at first by all in virtue of membership in the State, later by particular ones, who are paid for them. The commodities or wealth required may be produced by the State or taken from the citizens. In the ancient primitive community, services are rendered by the citizens as their proper contribution to the State. The commodities needed are for the most part furnished by the individuals without any recognition of a transfer of ownership to the State. The division of labour necessary for the successful administration of more complex affairs of the State demands a separation

of the persons permanently in the service of the State from the other classes. These must then be supported from somewhere, and in classical times this is accomplished by giving the State, or what is the same thing in classic thought, its special officers, the income from certain sources, as mines or productive enterprises, and taxes upon tributary peoples, or certain inferior classes of citizens. Out of these funds the public officers were supported, and those paid in the service of the State for the exercise of its functions were maintained.

Again, in the middle ages, feudalism furnished a mode of support for public officers by giving them a certain control over land and its occupants, a means which, without the use of money, provided services and commodities for the public needs.

Feudalism provides for the needs of the State without the use of money.

But later as money became more plentiful, and in ordinary transactions payments in kind and in services were commuted into payments in money, the government in turn commuted services due into money payments. At the same time, lands, originally conveyed to public officers in consideration of their public services, and to enable them to perform those services, passed absolutely into their control and were treated, in part at least, as their private property, and the services and commodities they yielded became the private income of these individuals and their families. But although the revenues from the domains, retained in this same way by those families, which

became the sovereigns, were still applied to public expenses, they soon became insufficient, as the State's functions grew, and other resources were sought. In the mad scramble for public revenues, old rights to dues and services were tenaciously retained by rulers or their officers. Especially were the claims to military and similar general services held. These claims, too, were finally commuted into money payments, which became compulsory just as the services from which they were derived had been compulsory.

The names used for the first revenues, which exceeded the receipts from domains and the customary services, show very distinctly the voluntary character of the payments. They are called beggings, requests, gifts (*beden*, *petitiones*, *benevolences*; *dona*), or from the point of view of the assistance given, aids (*aide*, *steuer*). With the gradual growth of the needs, for which these demands were made, into permanent needs, with the further centralisation and concentration of the public functions, the neglect of public duties by the feudal lords, and quasi-public officers quartered on the land, and with the consequent performance of these duties by the government, the demands upon the people became permanent and compulsory.

The voluntary character of the payments beyond the receipts from domains.

SEC. 2. Since the emergence of the monarchical State from feudalism the trend of affairs has been directed by the growth of constitutionalism,—or the representation of the people in the govern-

ment. As the whole advance of this movement turned upon the success of the people in obtaining

The growth of the control of the purse, it is evident that the resulting changes in the financial system must have been very important. The long history through which the different revenues have passed, the necessity of constant compromise between the

different interested parties, and the various changes made necessary by the growth in the economic life of the world, all these have left modern States with a most confused jumble of revenues. Yet with all the irregularities and anomalies that can be found in the revenues of any modern State, there is still in every case a more or less clearly traceable systematic development. This growth of system is clearly due to the work of the representatives, in whose hands the development of constitutional government finally placed the control of the collection and spending of the public money. As these representatives realised the need of revenues, they naturally sought for some principles of right and justice to guide them in the choice of sources. The result has been a partial uniformity in the systems of the different countries.

It should not, however, be imagined that this uniformity is very great, nor that the systems of the different countries are alike in details. But somewhat the same fundamental ideas seem to underlie all. There are also great differences. Thus one

country chooses to obtain the larger part of its revenues from a tax not used at all in another. Historical practices and differences in the frame of government necessitate *Slight differences in details.* modifications even of the same principle.

That bugbear of the student of Public Finance, practical expediency, which has ruined many a fine theory, works in the most astonishing ways to prevent the execution of approved principles.

SEC. 3. The uniformity above noted came about as a natural result of the general search by the agents of constitutional government for some good reason why, in each case, the particular person contributing should be called upon to do so. As the representatives of the people, they naturally had to satisfy, in some way, the reasonable desire of the people for some clearly defined method of apportionment. As it is generally hard enough to convince men of the need of contributing anything, the plea put forth must be a strong one. If we confine our attention, for the purposes of illustration, to taxes alone, which are the hardest of all revenues to justify, we can see more clearly how the necessity of thus showing good reasons *Different States find the same justification of taxes.* led to uniformity. It is evident that if the representatives had, for instance, informed their constituents that "taxes are one-sided transfers of economic goods or services"¹ they would have had considerable difficulty in getting consent

¹ Part of the definition of taxes by Professor Ely, pp. 6, 7.

to any taxes. But when they announced, "taxes are paid in return for the benefits conferred upon you by the government," it was easier to collect them. When they proceeded to assess taxes on the basis of a more or less definite attempt to measure the benefit conferred, or where, in the nature of things, an actual measurement was impossible on some other basis of supposed equality, they clearly had a very good case to present to their constituents. It requires but the slightest knowledge of the history of constitutional legislative bodies to prove conclusively that such was the process of reasoning. And this fully accounts for the similarity of the systems of various countries.

Whenever it was perfectly clear that a certain function conferred a special benefit on an individual citizen the charge was made on him, and those persons not so clearly benefited were wholly or partially exempt. Thus we have the practice of tolls from persons using the roads, of fees from the suitors at court, or the sale of some privilege or commodity to the citizens for a price, as in the case of granting a monopoly, or the sale of manufactured wares, or of lumber, or ore from the domains. But many of the more important functions do not result so clearly in a special benefit to the individual, and recourse is had to some other mode of justification. At first, naturally, the older ideas are developed. The services traditionally due from the citizen to the State, of which that of military service is the most

prominent example, are recalled and appealed to. It is claimed that money should be given in commutation of these services. Then the ground is shifted again and again, and many apparently different reasons are advanced. But in all these changes one thing is clear, — the shifting of argument is made in order to enable the use of some new measure of the amount of taxation, and at basis the justification remains practically the same. The citizen is asked to pay, because he shares in the benefits common to him and his fellows. But this common benefit does not suggest any particular measure.

Changes in the forms of taxation are due to the search for new measures.

SEC. 4. Another point of similarity between different nations must be studied historically; that is the feature of compulsion. This feature is old and universal. It is, perhaps, older than any one of the nations and began in that feudal system from which they emerged. The citizen had to be compelled to render his service to the State, whenever the special benefit to him was not clear. That feature the most advanced constitutional governments have retained. There have, to be sure, been instances where States, and especially cities, have had recourse to voluntary contributions to meet the expenses giving a special benefit. But these soon passed into compulsory. A fine example of the development of a voluntary contribution into a tax is found in the English poor-rate. In the twenty-seventh year of the reign of Henry VIII.,

Compulsion is a universal feature.

1536, collections were made for the impotent poor (voluntary). In the first Edward VI., 1547, bishops were authorised to prosecute all who refused to contribute for this purpose (compulsion enters). In the fifth Elizabeth, 1563, the Justices of the Peace were made judges of what constituted a reasonable contribution (compulsion as to the amount). And from the fourteenth Elizabeth, 1572, regular compulsory contributions were levied. So they have continued.

SEC. 5. We have already classified expenditures according to the character of the benefit conferred.¹

*Classification
of revenues
according as
they are just-
ified by com-
mon or special
benefit.*

Now the almost uniform practice is to collect compulsory revenues from all the citizens for those expenditures that confer a common benefit, or one that is so treated ; then to collect special compulsory revenues for a part of the cost from those persons regarded as specially benefited by expenditures of class three ; while the revenues for meeting the fourth class of expenditures are raised by the sale of the commodities or services.

Professor Seligman finds that there are three distinct classes of revenues, each resting on a different justification.² The first of these three we will call

¹ See Part I., Chap. I., sec. 6.

² See Seligman, "Classification of Revenues," in the *Quarterly Journal of Economics*, April, 1893, and April, 1895 ; *Essays*, Chap. IX. In my opinion Professor Seligman has not improved his classification by the refinements introduced in the second article. Nor is the necessity for distinguishing between fees and special assessments clear. Special assessments are a kind of fee, even within

taxes. This is a slightly narrowed use of the term. In the broadest sense an exercise of the taxing power of the State occurs whenever a compulsory contribution of wealth is taken from a person, private or corporate, under the authority of the public powers. But such a broad definition of taxes would include, also, the charges for expenditures of the third class, levied to pay the cost or part of the cost of a special service. As these are certainly different from those charges levied to meet the expenditures conferring a common benefit, it is necessary to adopt the narrower definition. In this sense then taxes are general compulsory contributions of wealth levied upon persons, natu- *Taxes defined.* ral or corporate, to defray the expenses incurred in conferring a common benefit upon the residents of the State. A tax is justified, but not necessarily measured, by the common benefit conferred.

When a distinct attempt is made to levy the charge only where a traceable or assumed special benefit is conferred, and to make it cover the cost, or a part of the cost, thereof, the compulsory payment is a fee. In the broadest sense fees are taxes, but they are not taxes in the narrower sense defined above, and compose a large and important class by themselves. A fee has a different justification from

the terms of the Professor's definition of fees. Nothing is gained by raising classes logically secondary in character to first place. It is sincerely hoped that the simple general outlines of Professor Seligman's classification, as given in the text, may find general acceptance.

a tax. A fee never exceeds the cost of the special service rendered. A charge for a special benefit that exceeds the cost is best regarded as consisting of two parts, one a fee, the other a special tax. A fee may be defined as a compulsory contribution of

Fees defined. wealth made by a person, natural or corporate, under the authority of the public powers to defray a part or all of the expenses involved in some action of the government, which, while creating a common benefit, also confers a special benefit, or one that is arbitrarily so regarded.

The third category of revenues is called by Professor Seligman prices. The price of the commodities or services made or rendered by the government differs in no essential particular from the price paid

Prices defined. for similar commodities or services rendered by individuals. The price is the value of these commodities expressed in terms of money. If the State has a monopoly, it may act as a private person would and take "all the traffic will bear," or it may forego a part of the possible gain, and the payment becomes or approaches a fee. If the State has no monopoly, it must, perforce, act as an individual would, subject to competition. Every civilised country has these three categories of revenues, and combinations thereof, and no more than these. Every civilised country recognises the same justification for each contribution. Every government appeals to the same motives to induce the payment of each class. In the case of the first two

classes the motive is compulsion, in the last the government withdraws and allows the interest of the individual to bring him forward and induce him to make the contribution. This class has been called voluntary. If this term meant merely the absence of compulsion, the spontaneity as it were of the contribution, it would be satisfactory. But generally there is the danger of confusion arising from the implication in the term that the contribution is without return, of the nature of a gift. Hence, in order to show the character of the payment, Professor Seligman has called it contractual. *Prices may be called contractual revenues.* There are serious objections to this term also, although it is of such a character as to admit of a technical application very easily. But in lieu of a better and for sake of uniformity we will adopt it.

SEC. 6. Thus far, for sake of simplicity, and not to depart from the usage of other writers, we have considered the revenues as practically identical with the money flowing into the treasury. Services rendered without pay do not belong to our subject. *Compulsory revenues are derivative ; contractual are not.* But still it is not quite accurate to identify the public revenues with the money that flows into the treasury. Money is here, as in private households, but the representative of wealth. When the government compels its subjects to pay contributions of classes one and two, taxes and fees, it does so in order to obtain control of wealth which it takes from the people to consume

for a public purpose. But in the case of contractual revenues the matter is quite different. Here the government simply sells, for money, wealth: material things, privileges, or services which it has brought into existence. The transaction is a simple sale. This is partly true of some fees. The money that flows into the treasury simply takes the place of actual wealth already created or being created by the government. The important thing to note is that prices result in little or no increase in the amount of wealth in the hands of the government, unlike the other cases, but a mere change in the form of the wealth already owned. It is not wealth taken from the people to be consumed by the government; but wealth created by the government is turned into money so that it may be more conveniently consumed. Nothing is taken from the people at all, for they receive back the equivalent of their money in wealth, over which they then have control as owners. In the case of compulsory rev-

Compulsory revenues leave the individual in the same position as though he had consumed his wealth. Contractual merely represent a change in form.

enues the matter is different because they receive back nothing tangible, but simply enjoy the common or special benefits of good government. These benefits are of the same character exactly as the benefits which accrue to the individual when he consumes his own wealth. They are "reproductive," if at all, in the same sense that the consumption of bread by the worker is repro-

ductive. That is in no sense at all. Just as the aim of all production in the economic world is consumption or the satisfaction of wants, so the end and aim of the compulsory collection of revenues is consumption by the State. Sometimes, to be sure, the government turns these funds into permanent forms of wealth which are slowly consumed; as, for example, roads. Sometimes, too, the government adds to the effective power of the wealth before consuming it, or uses it to produce new wealth; but yet so far as the individual is concerned, he has parted with his property in a way which leaves him benefited, to be sure, but in exactly the same position as when he spends the same amount for some gratification. Quite the contrary is his position when he buys a piece of china made by the government, for then he has the equivalent of his money. The government, too, is no richer than before, but has its wealth in a form which better suits it.¹ Frequently the government uses the wealth created directly without first turning it into money. This wealth is as much a part of the revenues as any that is sold.

We may now change our terminology slightly, and say that there are three sources of public revenues: the first is collected from all the citizens by compulsion, on the ground that certain expenditures are necessary and confer a common benefit upon all; these are taxes. The second is collected

¹ Cf. Stein, *Finanzwissenschaft*, II., 138.

by compulsion from certain persons on the ground that they are specially benefited by some expenditures; these are fees. And lastly, the State creates wealth for itself. The wealth thus created constitutes a part of the revenue of the government belonging to the third class. This, whether sold or not, is contractual revenue.

SEC. 7. One or two minor matters have to be noticed and our classification is complete. Sometimes

Other kinds of revenues, gifts, reversion, by eminent domain, fines, and penalties. States receive gifts, generally for some special purpose. These are now rare and unimportant. The special purpose is usually more or less outside the general functions of the State. Sometimes the

State receives property by reversion, or takes property which has no apparent owner. This, too, is an insignificant category. The State may exercise the right of eminent domain and take property for some purpose. Generally speaking, it restores an equal amount of some other kind of wealth, so this transaction results in no net revenue. The State is the recipient of not insignificant sums from fines and penalties inflicted under the penal power. These are compulsory contributions levied with an intent to injure, and differ materially from the other categories. Their nature is clear, and they will receive no further attention. All the receipts of the State come under one or the other of these categories.

CHAPTER II

THE CLASSIFICATION OF TAXES AND FEES;
DEFINITIONS

SECTION 1. Considerable confusion in the discussions of the different modes of taxation is due to the failure to distinguish clearly between the justification of taxation in general (*i.e.* *The measure of taxation distinguished from the justification.* why there should be any taxes at all), and the measure of taxation (*i.e.* what should be the basis upon which to decide how much each citizen should pay). The universally accepted justification of taxation is the common benefit conferred upon the individuals by the action of the government. But the common benefit is, strictly speaking, equal, while the taxed citizens are unequal in wealth. Therefore recourse has to be had to some other measure of taxation. It lay nearest, in the search for such a measure, to assume that there was a difference in the benefit enjoyed by the different citizens. Thus one theory assumes that protection to life, liberty, and property is the chief benefit conferred, and that this benefit, or at all *The benefit theory.* events its cost, varies as the property varies, generally in exactly the same proportion. This theory

has been called the benefit theory of taxation, because it attempts to estimate by the benefit conferred the amount of tax each individual should pay.

The difficulties involved in measuring benefit, with sufficient accuracy to serve as a basis for taxation, led another school of thinkers to abandon that entirely. These writers felt that each citizen was necessarily a part of the organism of the State, one of the nourishing cells as it were. And as in all organisms of nature each organ or each cell contributes to the life of the whole, in accordance with its powers or strength, so each citizen should contribute as he is able. They claim that it is easier to measure ability than it is to measure benefit. This

The faculty theory. theory is called the faculty theory, the term "faculty" having been found in this sense in early tax laws. Generally speaking, this ability is supposed to be indicated in some way by wealth. But the advocates of faculty as a measure of taxation encounter a serious difficulty in attempting to ascertain whether faculty is proportional to wealth or increases more rapidly as wealth increases. A negative side of the same idea is presented when it is claimed that the tax should impose an equal sacrifice upon every citizen. In determining what constitutes equal sacrifice, we encounter the same difficulty as in determining how to measure ability.¹

¹ See Chap. III. for further discussion of this point. A full and instructive discussion of these theories is to be found in Seligman's *Progressive Taxation in Theory and Practice*.

SEC. 2. It will be noticed that the basis from which each of these measures starts is wealth. The first argues that benefit is indicated by wealth, the second that faculty is so indicated. If wealth is the basis, then the classification of taxes might be made to depend on that of wealth. Such a method, *Difficulties in the way of finding a natural classification of taxes.* although tried, has been found impracticable, because the processes of shifting render it impossible to ascertain the final incidence with sufficient accuracy for classification. It has also been suggested that we might use the different specific means employed by nations to measure benefit or faculty. But here again we meet with difficulties that are almost insuperable; for in that case the classification will depend on the theory adopted as to the correct measures. If we adopt the benefit theory, our classification will depend on the different indices of benefit chosen. If we adopt the faculty theory, then our classification will be according to the indices of faculty. But we are not at liberty to adopt one or the other of these theories exclusively, because no nations have done so in practice, and their taxes are some of them based on the one theory, or at least best explained thereby, and some on the other, while many combine both or may be interpreted in either way. At the same time many taxes that could not be justified on either basis are retained by the nations on grounds of general expediency, because they yield considerable revenue,

or because they have been long in use. If, therefore, we adopt a classification presupposing either theory, we shall find many taxes that do not conform to it. Inasmuch as no consistent plan for the measurement of taxation has been adopted by any country, no uniform method of classification upon "natural" grounds can be found.

These difficulties are inherent in the matter that we are attempting to classify. The librarian generally desires to arrange his books according to the subjects treated. But *These difficulties are insuperable.* encyclopædias could not be so arranged without tearing the books to pieces. We might theoretically dissect each tax, and assign its parts to the different categories according to the real nature of each part. But we gain little by this painful process. In this case classification will not help us to ascertain the real nature of the things studied.

These difficulties have not always been regarded as insuperable, and many brave attempts have been made to overcome them, but with so little uniformity as to mark the failure. *Previous attempts at classification.* There are almost as many classifications as writers. The least satisfactory of all are those that attempt to find some natural arrangement. Those which have the most apparent success accept the official names used by the treasury departments of the different nations, and give them merely such limitation as is necessary to use them scientifically.

SEC. 3. Perhaps the most common distinction is that made between direct and indirect taxes. This distinction first obtained theoretical im-
 portance in the writings of the Physiocrats. By direct taxes they meant any of those taxes which were levied immediately upon the "produit net." There alone, they argued, could be the fund out of which taxes could be paid. To levy taxes anywhere else was indirect, because the burden would be shifted from one to another until it rested there. The assignment of any particular tax to one or the other of these categories was with them a mark of approval or condemnation. With the recognition that other economic processes besides those which added to the material property of the world created wealth, this peculiar theory of taxation drifted into abeyance. The same terms, however, have been widely used by officials and writers and have such prevalence that a recognition of them cannot be avoided.

The distinction between direct and indirect taxes is old, and important.

Rau and Wagner have made the most elaborate attempts to define the modern usage. In this they were only partly successful, because of irregularities in official usage. But despite these irregularities the terms are valuable. Wagner's distinction is practically as follows. There are two ways in which direct and indirect taxes differ. (1) In the case of direct taxes, at least in the expectation of the law-giver, the tax-payer is also the tax-bearer; any shifting of

Wagner's definitions of direct and indirect taxes.

the burden to another is not expected, not desired, and sometimes, even, forbidden, or subject to penalty. Indirect taxes are, *vice versa*, those in which the tax-payer is not permanently the tax-bearer, or is not intended to be ; but a shifting of the burden to another is expected and desired, and may even be prescribed.¹

But this element of shifting is not the only one that is essential to the idea. The second characteristic is what may be called the technical, administrative conception of direct and indirect taxes. It is based on the method of procedure. (2) Direct taxes are such as are regularly laid according to some fixed fact (or one so treated, and at least somewhat fixed), something regularly recurrent, and hence previously ascertainable, — a fact as of personality, of rank, of property, of earning, etc., — and are, consequently, assessed according to some list or roll. (Cadastre.) Indirect taxes, on the other hand, are such as are laid according to some changing, temporary, more or less accidental fact which is, consequently, not previously ascertainable, — something the result of processes, events, transactions, — and are laid and collected according to tariffs.²

These two methods of distinction follow quite closely the usages of theoretical writers and of offi-

¹ Wagner, *Finanzwissenschaft*, II., 1st ed., p. 269 ; 2d ed., sec. 97-100. Schönberg's *Handbuch*, 3d ed., III., p. 171.

² Wagner, *Finanzwissenschaft*, II., 2d ed., p. 239.

cial bureaux. There are important exceptions in some countries. Thus in France the customs duties are not officially classed as indirect *Exceptions in taxes, but form a class by themselves official usage.* akin to direct taxes. In the United States at the time of the Civil War the income tax was viewed by the courts as an indirect tax, or at least not as a direct tax in the sense of the Constitution.¹ This decision, however, was reversed in 1895 by a bare majority of the same court, which decided that a similar income tax was a direct tax in the meaning of the Constitution. This decision is in accord with the distinction made above.

The principal direct taxes are: the land taxes, building taxes, property taxes, poll taxes, class taxes, income taxes, industry taxes; the indirect taxes: the customs duties (with the ex- *Taxes belonging to each kind.* ception of the French), internal excise taxes, transaction taxes, most fees and licenses. The inheritance taxes, or death duties, as they are called in England, are not easy to classify. In the first sense they are direct taxes, and in the second they are indirect. This is, perhaps, the only important tax that cannot be easily classified. *The inheritance tax hard to classify.* The inheritance tax wherever it exists is used because it is expedient and without much cost yields a large return. It is levied

¹ Springer v. United States, 102 U. S. 508. See article "The Direct Tax of 1861," *Quarterly Journal of Economics*, July, 1889; Seligman, "The Income Tax," *Forum*, 1895.

at a time when the persons paying it are not in position to demand a strong justification. It is sometimes justified on the ground that it compensates for previously unpaid taxes. If this justification holds, then the inheritance tax must be classed as a direct tax.

SEC. 4. A few other terms which are often used as the names of different groups of taxes and help in a way to classify them must be mentioned in this connection. We sometimes speak of taxes as being separable into (1) those on persons, (2) those on property, (3) those on income. These terms do not indicate the final source from which the tax is paid, but the basis upon which it is levied.

1. In the case of personal taxes the different persons who are to pay the tax are listed and assessed, either (1) individually, as in the case of *per capita* taxes, or (2) as representatives of a group, as in the family or hearth taxes, or (3) according to some characteristic, as rank in life, office, employment, age, etc., supposed to be indicative of the benefit they receive from the government or their ability to pay. A complete system of such taxes might be built up, and it is possible to suppose that all the requirements of justice could be met thereby.

2. Taxes on property are those taxes which take the property owned by a person as the index either of the benefit received or of the ability to pay.

These taxes may be considered as pursuing property wherever it is to be found, with little or no regard for the personality of the owner. *Property taxes.* They are not, of course, in any but the most exceptional instances, paid out of property. But no particular regard is had to the real source of payment: They may be levied upon any and every kind of property. They are sometimes called real taxes from *res*, things. But this usage has no established sanction in English; in that language real taxes are taxes upon real estate.

3. Taxes on income in the broadest sense are all those taxes which make wealth in the process of acquisition the basis of assess- *Income taxes.* ment. These are of two principal kinds: (1) those which are levied upon the annual increment of wealth, as such, irrespective of the person who is the recipient thereof. That is, they treat the various items of wealth increment as the basis of taxation without regard to the grouping of these increments into a whole in the income of any particular person, and consider the person paying the tax, only in so far as he is an income producer through his own activities. This is the character of the British income tax. (2) Those which demand of each person, or seek to obtain concerning each person, a summary of the total income he receives. This latter tax is sometimes so treated as to make it difficult to distinguish it from a personal tax, for the different persons are listed and classed according to amount of income they receive.

By a peculiar and entirely unwarranted use of common English terms in a strange and foreign sense, *Subjective and objective taxes. An unallowable distinction.* property, income, and the like have been called the tax objects, and the corresponding taxes objective taxes, meaning that they are taxes on things in distinction from taxes on persons. On the other hand, the persons are called the tax subjects, and personal taxes called subjective. This usage, although it has the sanction of a great authority, in Professor Bastable, has fortunately not been favourably received. Professor Seligman, in a review of Bastable's book, pointed out that by the object of a tax we usually mean the purpose of the tax, and the tax subjects may be things as well as persons subjected to the tax.¹

SEC. 5. Following the lead of Adam Smith, various attempts have been made to classify taxes according as they fall upon one or the other of the different shares in distribution, — rent, interest, profits, and wages. But, as Bastable has well shown, the sources from which the different taxes are paid are generally a combination of several of these. The wealth or income of very few persons consists of simply one of these shares. The attempts to carry out such classifications consistently have failed. Bastable's attempted compromise by calling such taxes as can be traced directly to one or the

Classification of taxes, according as they fall upon rent, interest, profits or wages, fails.

¹ *Political Science Quarterly*, VII., p. 717.

other shares in distribution primary, and all others secondary, brings us to practically the same results that were gained by Wagner in the discussion of direct and indirect taxes. His primary taxes are those called direct taxes above, his secondary are the indirect.

One other important set of distinctions must receive our attention, because it has the sanction of two prominent authorities. Wagner suggested and Cohn accepted the classification into, taxes paid out of wealth at the time of its acquisition (*Erwerb*), or while in possession (*Besitz*), or upon its consumption (*Verbrauch*). This distinction, according to the stage in which the tax finds the wealth from which it is paid, is often useful in showing the effects of certain taxes.

Another very valuable distinction is that made by the term "taxes on revenue." Taxes on revenue are those that fall or are assessed on the revenue, or income yielded by different kinds of property. These are a species of taxes on acquisition.

The three sets of terms which we have used in this work are : (1) direct and indirect taxes, (2) personal, property, and income taxes, (3) taxes paid on wealth at acquisition, in possession, and at the time of consumption.

Another distinction based upon the method of fixing the rate is important because of the use made of it

in the American Constitution. That is the distinction between apportioned and proportioned taxes.

Proportioned and apportioned taxes. Taxes are apportioned when the whole amount to be raised is fixed and then divided among the different tax-payers. They are proportioned when the rate is fixed and then assessed on the base, which may be either the property or the income of the tax-payers.¹

SEC. 6. We now come to the important task of classifying fees. The essential consideration to be held in mind about these payments is that they cover a part of the total cost of certain governmental activities, which are performed for the benefit of all, but yet confer a real or assumed special benefit on the individual. When the payment covers the whole or a little more than the whole cost, it is a price. Since fees are levied upon the receivers of certain benefits from the government, it follows that the only classification for fees is that which shows what activities of the government convey the benefit. We can thus classify according to the different departments of the government, for the services of which fees are collected.

1. The most numerous are the judicial and legal fees, the character of which has already been made clear from the discussion of the nature of these expenditures.² Examples of

¹ See further definitions in sec. 8.

² See Part I., Chap. III., sec. 4.

these are the regular court costs and fees, probate fees, the charges for recording deeds, mortgages, contracts, marriages, etc.

2. Next come the administrative fees for the special services of that department. They are : police fees, charged for the special benefits accruing or supposed to accrue to the individuals from the exercise of the police power of the State ; the fees for education, when charged ; a large number of industrial and commercial fees for services rendered individuals in their industrial and commercial undertakings. The industrial fees include license charges for permission to carry on certain businesses (care must be taken not to confuse these with police fees, nor with business taxes assessed on the same plan). Commercial fees include road and canal tolls, harbour dues, and a number of similar charges.

A very important class of administrative fees are those known as special assessments or in England as "betterment" taxes, levied for local improvements affecting property, as streets, sewers, etc. Professor Seligman has defined these as follows: "A Special Assessment is a compulsory contribution paid once and for all to defray the cost of a specific improvement to property undertaken in the public interest, and levied by the government in proportion to the special benefits accruing to the property owner." He regards them as of so much importance as to make them a class of revenues

co-ordinate with taxes and fees. Strictly speaking, they are fees.

SEC. 7. The revenues derived from prices or from the production and sale of commodities or services are of exactly the same character as the earnings of the people. This is true whether the products sold are derived from the public domain or from public industry. The principle underlying this kind of revenue, the analysis thereof, and to a certain extent the disposition thereof, are the general subjects of Political Economy. To introduce a discussion of it here would be to invade the main fields of economic science. Surely, unless we commit the fallacy commonly attributed to the mercantilists of regarding money alone as wealth, and treat all the money flowing into the treasury as revenue, no matter whether it merely takes the place of other kinds of wealth or not, we must exclude a full discussion of prices from the subject of public revenues.

But since a great deal has been made by writers of note, of the money prices received in this way as a part of public revenues, a few words in defence of this position are necessary.¹ Let us take the common example of the water supply. We may suppose that a certain city is supplied with water by two private companies, both of which have the

¹ Most German authorities discuss either the net or the gross income from domains. Cf. Bastable and Seligman on "Classification."

right to lay pipes wherever they wish. They will then supply water, supposing that they actually compete, at prices determined mainly by the costs, *Example, the water supply.* which are those of management, interest on the "plant," the supplies and running expenses. The average prices will be considerably higher than need be by virtue of the duplication of the plant, etc. Suppose, however, before any material duplication is reached they unite, forming one company which has the monopoly. The charges will now be regulated by "what the traffic will bear," and provided the supply is ample will tend to conform to those rates which will yield the largest net returns. The principles by which monopoly prices are regulated are well known to students of economics. The charges in this case cannot be greater than the cost to the citizens of operating their own wells, nor even so high as to induce the citizens to economise materially in their use of water. But suppose that the townspeople are not content with the rates, or with the service. They attempt regulation and fail. They may determine to buy out the plant. Once the city owns the plant it may run it in one of four ways. (1) *The four methods of public management.* It may run it as the company did, to make the highest possible profits, charging all or nearly all the traffic will bear. The surplus over costs goes into the treasury and helps to defray the other expenditures. But the rules determining what the traffic will bear are rules of pure econom-

ics. There is absolutely no difference between this public business and a private business. The method of "charging what the traffic will bear" is the method in economic life of determining the value of commodities so sold. It takes the place in the sale of monopoly goods of the "free dickering of the market" by which the price of other goods is determined.¹ The private company had to pay expenses, so does the city; the private company enjoyed a surplus or made an "unearned increment," so does the city; the private company spent this surplus to the satisfaction of the wants of its stockholders; the city spends the surplus to the benefit or satisfaction of the general wants of the citizens, who may be regarded as its stockholders. Even if it foregoes taking quite all the surplus, the principle is the same. A private company often does that in deference to public opinion. (2) The city may decide not to make money, but to charge only what the service costs and make the service as good as possible. It then foregoes taking the full price of the wealth that it has produced and allows each consumer to enjoy the surplus. Then the payment by the citizen is a fee. (3) It may charge a fee much smaller than the cost, or a fee for all water consumed over a certain amount, but provide a certain

¹ See Sidgwick, Bk. II., Ch. X.; Andrews, *Institutes of Economics*, p. 112; Marshall, *Ec. of Ind.*, pp. 180 ff.; Senior, pp. 103-114; Sumner, *Essays*, p. 46; Hadley, *R. R. Trans.*, p. 100; Seligman, *Railway Tariffs, etc.*, pp. 8 ff.

amount of water for each citizen at the common cost. (4) It may distribute the water freely and pay for it out of the common fund derived from taxation. Now the sums received in the last three cases are all regarded as payments for the public service. They are an essential part of the public revenues, taxes, and fees. Their amount is not determined by

Only three of these methods governed by fiscal principles.

any process known to political economy for determining prices. But so long as the principles determining the amount of the money taken and the management of the business are, as in the first case, purely economic, there is no need of including this money, as distinct from the wealth produced in the revenues of the public treasury, and burdening financial science with a discussion of matters fully within the scope of the larger science. All that we need to say is that the State produced so and so much wealth in the form of such and such commodities which it sold for so and so much money. These economic industrial or commercial revenues are supplemented by others which are of a fiscal character.¹

As Professor Cohn has so well pointed out, it is a very different problem that we have to deal with when the management of some industry is made merely the form or means for collecting a tax from certain classes of persons. The French tobacco monopoly, for exam-

Taxation by means of industrial monopoly.

¹ Cf. Cohn, sec. 98.

ple, is not in any sense to be looked upon as an industry undertaken in the common interest, or even in the interest of a particular class. It is the aim of the French government to tax the users of tobacco. This aim is attained by other governments through different processes. The form of a monopoly has been found to be remarkably easy, expedient, and successful as a method of indirect taxation.

SEC. 8. The base of a tax is the thing or phenomenon upon which the tax is assessed. The base is not always the source. Thus a tax
The "base." based on property is generally paid out of income or revenue, which comes sometimes from the property, sometimes from some other source. The direct taxes are almost always called by the name of the "base."

The tax-rate is the amount of the tax falling on each unit of the base. The base is generally expressed in units of values; as for ex-
The "rate" and the "unit of the base." ample \$100 worth of property. It may, however, be some other unit, as one person, one ox, one acre, one yard, one ton, etc. Sometimes the unit of the base is very complex. For example, in Vermont the rate is so much, say \$1.50 on each \$1.00 in the "Grand List." But only 1 per cent of certain kinds of property is entered in the grand list. This arose, originally, from the custom of fixing a definite uniform value for each piece of property, as so much per acre of land, so much per head of cattle, so much per horse, irrespective of

the actual value, and then fixing the rate upon this artificially constructed base.

The rate may be proportioned, apportioned, progressive, degressive, or regressive.

When the rate is proportioned, it is the same per cent of all property. When it is apportioned, the total amount to be raised is ascertained and then distributed, share for share, on each unit of the base. *“Proportioned” rate; “apportioned” rate.*

A tax is progressive when the rate increases more rapidly than the base; that is, when a higher per cent is assessed upon the higher values than upon the lower. This progression may be regular and start from the very smallest base, or one unit. For example, the rate may increase in some geometrical ratio, while the base increases in an arithmetical ratio. Of course any set of ratios may be chosen. The progression may be irregular in several different ways. Thus the progression may go by stages; *i.e.* between certain limits, in arbitrarily fixed groups, the rate may be proportional, but increase gradually with each higher group. Or the progression may affect only certain parts of the base. That is, a certain minimum may be taxed proportionally, then a certain part taxed progressively, and the proportional rate may set in again after a certain high point has been reached. Again, a certain minimum may be altogether exempt, and the rate after that progressive. *“Progressive” rate.*

The rate is degressive when the progression grows

smaller as the base increases. There are various ways of accomplishing this. The most common is to .
"Degrassive" exempt a certain moderate amount of the
rate. base and deduct that amount from all larger sums, while a nominally proportional rate is levied on the remainder. In this way a proportionally increasing burden is laid on the larger amounts of the base ; but the ratio of increase grows gradually less, until, when the base reaches a very large amount, the increase in rate is practically nil, and the rate becomes practically proportional. For example, we may have an income tax in which the rate is 3 per cent on all income in excess of \$500. The man who has \$1000 pays 1.5 per cent on his whole income, while the man who has \$10,000 pays 2.85 per cent, and the rate approaches but never reaches 3 per cent by ever decreasing amounts. So that the man with an income of \$100,000 pays only 0.0015 less than three per cent. Another method is to make a deduction for the incomes below a certain amount only, the rate above that being proportional. A degressive rate is properly an irregular form of progression. Both progressive and degressive taxes are sometimes called graduated.

A regressive rate is just the reverse of a progressive or of a degressive rate. In this case the rate
"Regressive" decreases as the property increases, and
rate. a heavier burden is laid on the smaller amounts. The regressive rate may be irregular in as many ways as the progressive. That is, it may

vary in the reverse of any of the ways in which the progressive rate may vary.

Assessment is the name applied to the whole process of ascertaining the amount of tax due from each person or property. It consists of two "*Assessment*," steps, (1) the valuation of the property or income, or the listing of the things taxed; (2) the levying of the rate or tax, that is fixing the amount each unit is to pay.

The tax list or roll contains the record of the amounts assessed and levied. In some European countries these lists are, for certain taxes, elaborate, permanent, or partly permanent records which serve various legal purposes as well as the fiscal, as for example the record of titles, and are called *cadastres*. "*Tax list.*"

Impost is a general term for any tax, but there is a tendency to make it synonymous with indirect taxes. "*Impost.*"

Customs duties are indirect taxes levied on the goods imported into or exported from certain territories. "*Customs duties.*"

Excises (English) or internal revenue taxes (American) are indirect taxes levied on goods produced or consumed within certain territorial limits. "*Excises*" or "*Internal revenue taxes.*"

Toll was originally a general term for many taxes, but it has come to have a special meaning, and applies only to the charges for passage over roads, bridges, canals, etc. "*Toll.*"

A tax is said to be shifted when the tax-payer reimburses himself from some one else.
“Shifting” reimburses himself from some one else.
and “inci-” The final incidence of the tax is the
dence.” falling of the burden upon some person who does not shift it.

CHAPTER III

THE TAX SYSTEM

SECTION 1. No nation has ever found it feasible to adopt any single tax as the sole source of its income. No nation at all advanced in civilisation has attempted to conduct its government entirely from the earnings of its domains or industries. Every civilised nation of to-day combines the three sorts of revenues, those produced by its own activities and those obtained from taxation and from fees. And furthermore, no nation attempts to exist with only one of each of these kinds of revenues. These different forms are combined into a “system” or general scheme, which conforms more or less closely to the general ideal of justice which may have been adopted by the nation. To judge of the justice or expediency of any tax it should be studied in its place in the “system.” We have already seen the two main theories as to the proper measure of taxation, the one, that taxation should be measured by benefit, the other, that it should be measured by faculty. A perfect system would so combine the different forms that the total burden imposed would be in accord with the ideal adopted.

*Taxes
of various
sorts are com-
bined into the
national sys-
tem.*

There is a constant tendency toward the simplification of tax systems, although most modern systems *The dream of* are still extremely complicated. It is *a single tax.* the dream of financial theorists, and has been ever since the science began, and it is the aim of many would-be reformers, to find a single tax that will furnish all the necessary funds for the support of the government. The Physiocratic *impôt unique* on the *produit net* is well known, as is also the justification therefor. It is also well known wherein this fails. Modern proposals generally involve something more than mere tax reform. The socialistic

Single progressive income tax, and the Georgian land tax. demand for a single, exclusive income tax with a progressive rate, is advanced with a hope of effecting a redistribution of the wealth of the world. Henry George's well-known scheme for a single tax on land has a similar ulterior purpose. His object is to free industry from trammels which he supposes are due to the existence of private property in land. In form his proposition is not unlike that of the Physiocrats. He is an extreme individualist, but he aims, like the socialists, at a new distribution of property. Of these two modern schemes for a single tax the first is perfectly feasible from the fiscal point of view. Such a tax could probably be administered and could be made to yield ample revenue. It fails, however, to answer the simplest requirements of justice. For example, it would not, unless our whole scheme of economic life

were first altered, seem just that the man whose property was benefited by the grading and metalling of a street should be entirely free from a special charge for the special benefit. *The socialistic income tax feasible but unjust.* The scheme is inexpedient for three reasons: (1) it presupposes for its successful administration a method of distribution of wealth very different from that which the world now has; (2) it demands a perfection in the technique of administration as yet absolutely unattainable; (3) it would need, in order to be fairly administered, more honesty than men have yet shown in their dealings with the government. None of these reasons militate in the least against the incorporation of an income tax in the tax system, beside other taxes. They apply only to its use as the sole source of income.

But the second scheme, that of Henry George, is not only unjust and inexpedient, it is also not feasible, since it would not yield the necessary revenues.¹ It is unjust because its fundamental concept, that land values are solely due to the presence of a large number of inhabitants, is untrue. *The Georgian single tax would not yield sufficient revenue.* The value of land, like that of other wealth, depends on the use to which it may be put. Moreover, as improvements are not to be taxed, it would mean a heavier burden on farming lands than on city

¹ See Spahr, "The Single Tax," *Political Science Quarterly*, 1891; Seligman, *Essays*, pp. 64-94.

property. But in no case would the scheme yield sufficient revenue. It has been estimated that if the entire annual rental of the land of England were appropriated by the government, it would fall \$200,000,000, or £40,000,000, short of what is now needed to support the government. In the United States the matter is a little more difficult to estimate because it is not feasible to get a statement of the value of the land apart from the improvements thereon. Taxable real estate including improvements is estimated by the Eleventh Census at \$35,711,209,108. This was assessed at \$18,956,556,675. The value of the improvements is hard to estimate. Probably it is on the average at least two-thirds of the total value. But in order not to err on the side which favours our argument we will estimate the improvements at merely one-third of the total, which is certainly a moderate estimate. That would leave \$23,807,472,739 as the highest value of the land. Suppose we take 3 per cent as the annual rental; we have \$714,224,182 as the sum available for the single tax. Now the national government, the commonwealth governments, and the municipalities spend together over \$915,954,055 annually. That is, at the most favourable estimate the single tax would fall \$200,000,000 short of what is necessary to maintain the governments. Mr. Spahr estimates that in Connecticut the assessed value of land increased \$36,000,000 during a period in which \$70,000,000 were paid in commonwealth and local

taxes. All of these figures, which err on the side of moderation, show conclusively that even in the United States no tax on land, alone, sufficiently large to pay the entire expenses of the government could be laid without appropriating enough to ruin the user of the land, and practically prohibit its cultivation.

It may be urged that as the existing land taxes are regular charges, their capitalised value has already been deducted from the value of the land. But this would only be true if all the taxes now *All taxes not capitalised and deducted in the present value of land.* fell upon the land. Most of the existing taxes, however, fall upon other sources of revenue and improvements. The abolition of all other taxes on different forms of property would also be unjust. This can be shown without abandoning the ground of the Georgian doctrine. Every kind of economic wealth may, under certain circumstances, and frequently does increase in value in such a way as to yield its owner an "unearned" increment. Why should that escape, and the "unearned" increment of land values alone be taxed?

Every tax tends to repress the development of the particular phenomenon on which it rests. A single tax of any kind will tend to *A single tax would defeat its own ends by repressing the thing upon which based.* defeat its own ends by repressing the existence of the phenomenon which forms the signal for its assessment. For example, in Mexico land is not taxed, but if the

farmer kills a cow, or sells a crop, he is taxed. Naturally this discourages any extension of the uses of land that involve this disagreeable consequence. The experience of nations which has led them to diversify the forms of their taxation is, therefore, supported by theoretical considerations. The tax system of the United States is still, and the tax systems of all European nations have been, until recently, and are yet in great measure, *Tax system of modern nations not logical.* mere accidental jumbles of different historical taxes, which are retained simply for the revenue that they yield and not because of any belief in their justice. It is not often that nations are rich enough to enjoy what Professor Cohn has well called the "luxury of reform for reform's sake." Their reforms have been most often undertaken for the sake of increased revenues.

To be sure, the rough edges have been somewhat worn away by the friction of economic forces, and the process of tax shifting has in some instances removed some of the worst injustices. But examined from the standpoint of some ideal system, the tax systems of many modern nations fail woefully. It matters little which ideal be the one held up by which to test them; whether it be that of the benefit theory, or that of the faculty theory, the failure is the same.

SEC. 2. What in the opinion of nations constitutes the ideal of correct or just taxation? The answer to this question is to be sought in the

theories of taxation that have found favour, and are generally contained in the writings of economists and financiers. The Physiocratic answer was, we have seen, inadequate. The benefit theory would say that each citizen should pay according to the benefit he receives. What is the benefit and how is it measured? The common benefits are, clearly, the peaceful enjoyment of life, liberty, and property. The protection the State affords to life and liberty is theoretically equal for all, that to properties varies directly, as the property varies.¹ A uniform tax on each poll for the first two benefits, and a proportional tax on property, would seem to answer the requirements of this theory with sufficient accuracy. But the relatively small returns from the poll taxes and the great expense and friction of collecting them soon led to their partial abandonment. Property then remained the basis. The value of property seemed clearly to depend on its revenue-yielding power. It is a matter of comparative indifference which is taken. Hence the idea embodied in the famous dictum of Adam Smith: "The subjects of every State ought to contribute toward the support of the government, as nearly as possible, . . . in proportion to the revenues which they respectively

¹ The benefit theory has been illogically developed into a defence of progressive taxation. See Seligman, *Prog. Tax.*, pp. 110 ff. I have not included this illogical side in the discussion.

enjoy under the protection of the State.”¹ But here again as the industrial population separated from the soil and a large body of citizens arose, who had no land and little personal property, and who could ill afford to part with any of their earnings, humanity and expediency urged the exemption of the minimum of subsistence. It cost too much and caused too much bitterness to collect taxes upon those having only the bare necessities. Then came Ricardo’s suggestion, “the power of paying taxes is in proportion to the net, and not in proportion to the gross revenue.” The items that were to be deducted were the costs of production, among which were then counted the bread and meat for the labourers, which were regarded very much as so much fuel shovelled into the furnace of a human machine. Hence it was argued that it would be too burdensome to production to tax what was necessary to maintain the productive power of the workers. A certain amount of income, therefore, should be exempt; for if taxed, the tax would certainly be shifted. Fortunately, according to the prevalent theory of wages, the amount to be exempted would remain fixed, or nearly so, advancing, if at all, very slowly. So that all incomes over a fixed amount were to be taxed proportionally; since the benefit to such individuals as possessed incomes above the chosen minimum was supposed to be in

¹ Bk. V., Chap. II., Part II. On the various interpretations of this passage see Seligman, *Prog. Tax.*, p. 94.

exact proportion to the amount in excess of the minimum. Stated broadly, this theory was as follows. All taxes must be proportioned to benefit. Certain classes only are benefited, namely, those having income over a certain amount; that is, over the minimum of subsistence. They should be taxed on the amount above that minimum of subsistence. It would seem, then, that the money spent in protection of the workers who lived on the minimum of subsistence was to be treated as if of benefit to the other classes. This puts the worker in the same category with the pauper for whom the State, from reasons of humanity, decides that it is worth while to care. With a clearer perception of the character of production and a realisation of the fact that the worker was a man the satisfaction of whose wants, even if they did not exceed the minimum of subsistence, was yet as important as the satisfaction of the higher wants of other classes, came a realisation of the inadequacy of this theory. It is now quite generally abandoned, except as the legal theory in America.

Perhaps the best statement of the United States legal theory of what constitutes the just measure of taxation is given by Judge Cooley.¹ *The legal theory in the United States.* "If it were practicable to do so, the taxes levied by the government ought to be apportioned among the people according to the benefit which each receives from the protection

¹ *Taxation*, p. 24.

the government affords him ; but this is manifestly impossible. The value of life, liberty, and of the social and family rights and privileges, cannot be measured by any pecuniary standard ; and by the general consent of civilised nations, income or the sources of income are almost universally made the basis upon which the ordinary taxes are estimated. This is upon the assumption, never wholly true in point of fact, but sufficiently near the truth for the practical operations of government, that the benefit received from the government bears some proportion to the property held, or the revenue enjoyed under its protection ; and though this can never be arrived at with accuracy, through the operation of any general rule, and would not be wholly just if it could be, experience has given us no better standard, and it is applied in a great variety of forms, and with more or less approximation to justice and equality. But, as before stated, other considerations are always admissible ; what is aimed at is, not taxes strictly just, but such taxes as will best subserve the general welfare of political society."

Benefit as a measure of taxation is therefore according to the admission of one of its strongest advocates inadequate. Only in special instances can benefit be directly measured. There, of course, it has been and will remain the basis of taxation, at least until the State shall decide that the special benefit has been merged in the common benefit.

SEC. 3. But the faculty theory, while offering some difficulties, is on the whole more satisfactory. The faculty theory is well illustrated by the history of the English poor law, to which reference has already been made. *The faculty theory illustrated by the English poor law.* At first the attempt was made to supply the wants of the poor by voluntary contributions. But it soon became apparent that all were not contributing "as God had prospered them." The idea that the support of the poor was a benefit to the other classes, except, perhaps, so far as almsgiving was supposed to ensure a man's salvation, did not appeal to the legislators. They anxiously avoided making the contribution compulsory because it would be hard to justify such a policy by pointing to any benefit. But they felt that fairness demanded that each should contribute according to his ability. Indeed, this was their understanding of the Divine command upon which they were consciously acting. The Justices of Peace were, without any very definite instructions as to the mode of procedure, authorised to see that each person contributed fairly according to his ability.¹

What then constitutes ability? The original idea seems to have been that the possession of property constituted ability. But the value of property depends upon its power to yield the owner a revenue. *Original idea of faculty.* If we consider landed property only, we find historically the greatest un-

¹ Ashley, *Economic History*, II., p. 360.

certainty as to whether men should be assessed according to some estimate of the salable value or according to its annual yield. This uncertainty

The salable value or the annual produce. arose from the nature of things. The salable value of landed property was, of course, determined by the annual

produce or revenue-yielding power. In the middle ages land was not salable property; hence, it was the custom to value it for purposes of taxation according to the annual produce, or the annual rental value, which was determined by the produce. The history of taxation in the American colonies is very instructive as to the method of determining what constitutes faculty or ability to pay. Here for the first time in history, or at least since the fall of Rome, was a country that enjoyed almost absolute free trade in land. When the Connecticut proprietors bought in fee simple lands in Vermont, which they had never seen, to be sold again on the same terms to settlers, whom they had never seen, often for prices which the same lands would not bring

Free trade in land in New England. to-day, they were doing what was not possible in any European country at the time and what is only partly possible

in most of them to-day, *i.e.* selling land as one sells wheat or any other commodity. The New England colonists, therefore, had the choice of two methods of assessing property in land: they could follow the older method to which they were accustomed at home, which assessed the rental value of

the property, or they could take some method suggested by the fact that lands were really sold, in fee simple, for a price. In general they chose the latter, although there are numerous traces of the old method both in the tax laws and in other regulations that are of a similar character. It is unfortunate that none of the investigations into the history of this period have been specially directed toward this point. Vermont furnishes one of the best examples of the principles underlying the colonial ideas of taxation.¹ There the conditions were very simple. Taxation was intended to cover all male inhabitants. Every male between 16 and 60 years of age, with a few definite exceptions, was "rated" at £6 on his person. That is, everybody was considered to be able to contribute something, whether he had property or not. Then the different items of property were "set in the list" over against the name of the owner at fixed rates. For example, each acre of improved land, 10s.; an ox or steer four years old £4; three years old, £3; two years old, £2; one year old, £1; a horse three years old or over, £3; all "horse kind" two years old, £2. Money on hand, or due, was listed at £6 in the £100. Then all persons were listed "for their faculty," according to occupation and earnings: attorneys at from £50 upwards, as the value of their prac-

*Taxation of
faculty in
Vermont.*

¹ Wood, *History of Taxation in Vermont*. Columbia College Studies, IV. 3.

tice increased; all tradesmen, traders, and artificers "proportionally to their gains and returns." Other items of property were entered in the list in a similar way at fixed rates. The sum total of all the different items over against the name of each person was supposed to represent his total ability or faculty. The notable thing about all this is that only revenue-yielding property was listed. It was not a property tax purely, nor an income tax. But the thing which it sought to ascertain was 'how much ability or faculty each person had. All property that was regarded as indicative of faculty was listed, and many other things that were also indicative of faculty were included. Later, however, Vermont adopted a form more nearly in accord with the idea that property alone indicates faculty.

There are then two ways of ascertaining faculty. In the one the base is primarily the property irre-
Faculty meas- spective of the revenue the property
ured by prop- yields. In the other it is income from
erty or by property or from other sources. There
income. are, also, two ways of completing the measurement: We may assume that faculty is proportional to property or income; that is, that it increases in exactly the same ratio as property and income increase. Or we may assume that it increases more rapidly than either property or income. The choice of base and the choice of rate have given rise to long and weary discussions and hair-splitting dis-

tinctions. In regard to the first, it is sufficient to say that at present the most widely accepted view is that, from the standpoint of abstract justice, income forms a better starting-point for the determination of faculty than property. But we cannot avoid entering the discussion as to whether faculty is in proportion to income or increases *Faculty increases more rapidly than property or income.* more rapidly. The widespread advance of democracy, and of sympathy for those in the lower walks of life, led to the desire to justify if possible the exemption of smaller incomes, especially the minimum of subsistence, and this desire found means of fulfilment in the newer theories of value, the conception of final utility, and the discussion as to the relative urgency of different wants. If we classify certain wants as absolute necessities, then the conclusion is near that the possessor of the minimum of subsistence has no ability to pay taxes. The possessor of a great deal more than the minimum of subsistence can in proportion bear more taxes than one who has only enough to obtain a few comforts in addition to the necessities. That is, the test of justice is found in equality of sacrifice, and we impose a greater sacrifice if we take away from the labouring man with \$1500 a year 10 per cent of his income, than we impose on the capitalist with \$15,000 annual income by taxing him in the same proportion. Moreover, if we look upon faculty as identical with general economic power, then it is clear that, as the control of wealth

increases, the ease of further increase is greater. Thus it is easier relatively for the millionaire to double his fortune than it is for the daily wage-earner to rise to independence.

SEC. 4. There are two other theories, which, independent of the idea of sacrifice or of increased economic power, attempt to justify a higher rate of taxation for higher incomes than for lower. These two theories adopt the hypothesis that the common benefit is equal, and demand that the inequalities in wealth should be removed in order to make it easily possible to tax according to this equal benefit. There are, first, those who argue that the inequalities in wealth are due in large measure to the action of the State, and hence the State is justified in abandoning the idea of equality of taxation and in taxing those who have much wealth more heavily than others, for they have gained from the State's own action. This has been called the compensatory theory. Others, again, starting from the same hypothesis, urge that taxation cannot be equal, because evil economic forces have changed the abilities of the tax-payers and that it is the duty of the State to offset these forces by readjusting wealth through taxation. This has been called the socialistic theory. Neither of these theories can justly be called scientific; they both cut loose entirely from existing conditions.

We cannot within the limits of this work attempt

an exhaustive criticism of all the different theories as to justice in taxation. Indeed, we have already exceeded the limits of pure scientific inquiry. But the conclusions reached by Professor *Seligman's* Seligman after an exhaustive study of *conclusions as to progression.* all the different theories are too important to be omitted.¹ He finds the benefit theory, like the socialistic and compensatory theories, wholly inadequate. But the faculty theory is satisfactory and seems to him to justify a moderate progression. Greater faculty is represented by the higher income: (1) because, after the initial disadvantages have been overcome, it is easier to acquire more; (2) because the sacrifice of the same proportion of the larger income is less than in the smaller income. Neither of these reasons suggests a definite rate of progression. He says: "If therefore we sum up the whole discussion, we see that while progressive taxation is to a certain extent defensible as an ideal, and as the expression of the theoretical demand for the shaping of taxes to the test of individual faculty, it is a matter of considerable difficulty to decide how far or in what manner the principle ought to be actually carried out in practice."

It would seem, then, that, in general, faculty is the ideal base of taxation; that faculty can be measured either by property or by income, but best by the latter; that faculty increases somewhat progressively and is affected by the consideration of

¹ *Prog. Tax. in Theory and Practice*, pp. 190 ff.

relative conditions, as the kind of property, the source of the income, or the burdens already resting upon the individual or property. All these considerations have to be applied in determining whether the tax system of any country complies with the rules of justice. They do not apply with the same strictness to the separate taxes.¹

¹ The recognition of the principle of progression in the recent reforms of taxation is very marked. See Seligman, *Essays*, 305 ff.

CHAPTER IV

THE DEVELOPMENT OF TAXATION BEFORE THE
INDUSTRIAL REVOLUTION

SECTION 1. Feudalism placed a large number of economic receipts directly in the hands of the rulers. These receipts were generally sufficient for the discharge of the customary public activities. It is a mistake, therefore, *Taxes not found under feudalism.* to search for taxes proper in the period of the supremacy of feudalism; that is, from the capitulary of Charles the Bald, 877, to the end of the thirteenth century. Taxes begin to emerge with the transformation of feudal rights and dues, the commutation of obligatory military services, and the like into payments in kind or in money. Greek and Roman forms of taxation had even less influence on modern systems of taxation than Greek and Roman forms of expenditure on modern spending. For the study of Roman law and the traditions of the glory of the Roman Empire determined many State activities that involved the spending of public wealth. But new methods of obtaining the funds were devised. Information concerning the taxes of the period from the fall of Rome to the capitulary of Charles the Bald is rather meagre and too vague to be of much value.

The first taxes to emerge from the darkness of this period are a number of fee-like contributions of the nature of commuted feudal services, *Early taxes were commuted feudal dues.* or directly connected with feudal rights, certain market dues and customs duties, tolls for protection to travellers, for the use of roads, bridges and ferries, and two forms of property taxes, land taxes and family taxes. The land taxes of this period are just emerging from the character of rent payments and acquire only by degrees the features of pure taxes. Even in the case of land left to the original possessors after conquest, the payments demanded are more of the character of rents than of taxes. But the combination of these charges with hearth or family taxes leads to the formation of a sort of mixed property and personal taxes. The fact that land is practically the only kind of revenue yielding property and that no considerable earnings are made without the use of land makes this tax sufficiently universal for the demands of justice.

Direct taxes are in this period, as in classical times, never paid by the freeman. They are regarded as *The freeman exempt.* derogatory and as the badge of a servile position. The freeman could give his services to the State, he could risk his life for it, but he would regard it as a deadly insult if he were asked to pay taxes. Indirectly, of course, he was taxed, as, for example, when he bought merchandise, for permission to sell which the trader was taxed.

As soon, however, as industry began to develop,

as soon as the crafts sprang up in the cities which clustered around the market-places, and classes which had lived in part from industrial pursuits found it possible to obtain so wide a market that they could live entirely from their industry, then, there arose such a differentiation of the sources of wealth that the old forms of taxation were insufficient. Taxation had, therefore, to be extended to *Taxation extended to meet the new forms of wealth.* The first methods of taxing these were dictated solely by expediency and the desire of obtaining as large revenues as possible, rather than by any definite ideas of justice, and were mainly indirect in character and partly an extension of the older market dues, excises, customs, and tolls, together with new taxes of the same kind.

Of old Roman taxes none can be strictly said to have survived the conquest. Some lasted throughout the Merovingian period in a greatly changed form. Finally they were merged into various feudal payments, and took on the nature of rents. A few relatively insignificant market dues and fees constitute the only taxes which regularly formed a part of the revenues of the State or of the State's officers, the feudal lords. The regular feudal burdens, while economic in character and not fiscal, *Feudal dues form a burden as heavy as taxes.* really fill the place of the later direct taxes. In proportion to the prosperity of the people they were certainly as heavy as any modern systems of taxes. The rapid disintegration

of the German Empire into smaller territorial lordships after the sixteenth and seventeenth centuries, rendered the question of imperial taxation at once less pressing and more complicated. On some eleven different occasions, according to Wagner, between 1427 and 1550 the Empire as such stood in need of extra revenues, for purposes so clearly of common benefit as to justify a demand for common contributions. Such an instance is that of the Hussite and Turkish wars. The tax used was the "common penny." This direct imperial tax was a mixture of poll and personal taxes with income and property taxes. We find very similar taxes in France and England. It fell upon all imperial subjects, whether holding from the crown or not, provided they held property. The rate was an irregular regressive one, being smaller for all above a certain amount of property. It was very badly administered and not universally collected.¹

In the German principalities that were formed out of the German Empire the first direct taxes were the *bedes*. These were extra payments, similar in form to the existing feudal contributions. They were made by those already paying such dues and were measured in somewhat similar ways. The basis was generally landed property. The first *bedes* were more or less voluntary, private contributions for the support of the *Vogt*,

¹ Cf. Wagner, Schönberg's *Handbuch*, 3d ed., III., 184.

count, or lord for some recognised public purpose. By contracts entered into between the contributors and the lords, they became compulsory and formed part of the regular income of the lords, who then in extraordinary cases of need would again come forward with the demand for extra or "necessity" *bedes*. This was frequently done in times of war. Hence, these *bedes* were often called "army *bedes*." Some of these in turn became customary or fixed. With the rise of the idea of public life and public needs, the *bedes* easily became compulsory public contributions, and were regarded as distinct from the feudal dues, which by virtue of longer standing and the absence of a recognised public purpose were treated as the private revenues of the prince. A peculiarity of the earlier assessments of the *bedes* was the method of apportionment to, or assumption by, the different orders or cities of a certain lump sum, which was then distributed by their own rulers among the different members, according to some measure agreed upon. Prelates, clergy, "*Donative monies.*" and knights were exempt from the ordinary *bedes*. They sometimes rendered similar contributions, hedging themselves in with all sorts of reserves and precautions, to prevent the payments becoming regular. These were called "donative monies."

It was in the cities that retained a large degree of political independence that the highest development of the fiscal system was to be found in the

middle ages. This is owing to the fact that they were in advance of the rest of the country in their economic development. Long before the principalities were able to abandon payments in kind and services, the cities were collecting taxes in money, making some use of public credit and developing regular fiscal offices. "The art of taxation," says Wagner,¹ "the use of public credit, and the practical organisation of the financial administration in the cities had been an important part of public institutions for centuries before the territorial State had even recognised the need of such." This field has, however, not yet received the attention of historical investigators sufficiently to allow us to draw conclusions as to the generally prevailing forms.²

SEC. 2. In France the early growth of a strong central power led to an intensification and sharp differentiation of the royal feudal dues from the other feudal charges, which gives them something the character of taxes. But inasmuch as the French State was peculiarly a proprietary State, and the territory was rather a part of the private property of the king than public property in the modern sense, these early charges are not taxes proper, but rents, or, to use the more general term, feudal dues. But the rapid growth of the central power, and the high

Royal feudal dues in France not properly taxes.

¹ Schönberg's *Handbuch*, 3d ed., III., 185.

² See Schönberg's "Investigations into the City of Basel."

development of public needs in the kingdom, necessitated more revenues. These needs were at first met by the collection of indirect consumption and trade taxes. The tendency toward the development of indirect taxes grew apace after the seventeenth century. The mercantile theory, which was supreme for most of the time after Colbert, developed customs duties very highly, and these ran parallel with internal consumption taxes. In the eighteenth century there were three, or possibly four, important taxes which had grown up in various ways out of the feudal dues. These were the "*taille*"¹ (tallage), the "*vingtièmes*" (twentieths), the "*capitation*" (poll), and possibly the "*dîmes*" (tithes).²

The *taille* is of feudal origin. Originally it was arbitrarily assessed with extreme rigour upon the serfs by the lords, and occasionally upon the great vassals by the king with the assent of the peers. It became a permanent charge when royal power was

¹ The term "*taille*," in English, tallage, also spelled *talliage*, *tailage*, and *taillage*, is from a root meaning to cut. It is explained as derived from the general method of keeping accounts by means of notched sticks. A *taille* was any sum of which account was kept, then the amount scored up (tallied) against any person. Slender sticks with notches called "tally sticks" were used by the English exchequer for accounts, until abolished by the statute of 23 Geo. III., c. 82. Similarly, the German "Kerbe," tally sticks. Other roots meaning to cut are common in the names of various taxes: viz., *incisio*, *incisura*, *cise*, later *accise*, *adcisio*, Eng. excise; in these Latin roots the thought is, that a part of the taxed article is cut out for the government.

² See Vignes, Ed., *Traité des Impôts en France*, 1872, p. 10.

firmly established on the ruins of feudalism. Charles VIII. made it permanent at the same time with the establishment of the royal army. The *taille* was both real and personal. On the one side it was based on the revenue from landed property; on the other, it was based on the faculty of the tax-payer, measured by the revenues from his landed property, and active rents, as well as the products of his own industry. This tax, suppressed in 1790, yielded 44,737,800 livres the year before. Necker obtained 91,000,000 livres from it. Nobles and clergy were exempt.

The *vingtièmes* consisted of one or more twentieth parts of the revenues from either landed or movable property. This tax had a varied history. At first it was used with the *taille*, but when that tax was made permanent under Charles VIII. the *vingtième* disappeared. It was revived in 1710 by Louis XIV. as a war tax. It remained as the occasional resource of the treasury up to the Revolution. Only the clergy were exempt. It produced 46,000,000 livres (Necker 55,000,000).

The *capitation*, or system of poll taxes, was the variable tax of the ancient monarchy. It dates from 1695. It was at first regarded as a temporary expedient, but was continued to the Revolution. It was assessed according to a tariff of twenty-two classes. But the base was frequently changed. The clergy were exempt, the

nobles were taxed on the basis of their presumptive ability, and those who paid the *taille* were taxed according to the amount of that tax they paid. In 1786 it yielded 41,500,000 livres.

The *dîme*, or tithe, was an assessment paid in kind from the fruits of the soil for the benefit of the clergy. The tax was not always the tenth, but varied from one-seventh to one thirty-second. The ecclesiastical purpose of this payment has led some to refuse to call it a tax in the strict sense. Since the church exercised a power that differed little from that of the State and the burden was a regular one maintained for a public purpose, it should probably be called a tax.

The *corvées* were more strictly taxes than the *dîmes*. These were personal services applied to the construction of the roads and other public works. They were regarded as feudal dues. They were of two kinds: the first were levied on property and rendered by the proprietor for his lands, and the second were levied on persons and rendered by all irrespective of land-holding. The nobles and the aliens were not subject to the personal *corvées*. The clergy could commute them into money payments or have them rendered at their own cost. The land *corvées* were due from all hereditary proprietors irrespective of rank, but they were not bound to furnish them in person. Louis XVI. suppressed the *corvées* in 1776, but they were re-established. They disappeared in 1793.

The most important indirect consumption taxes were leased for 166,000,000 livres, and those collected by the government were 51,500,000 livres. These together nearly equalled the revenue from direct taxes. The indirect taxes of the ancient monarchy were: first, the *aides*, which consisted of taxes on drinks, on articles of gold and silver, on iron, oil, skins, starch, bills, paper, etc., and the *octrois*, levied at the city gates on all sorts of goods when brought into the towns; second, the *gabelle*, or salt tax, which was so arranged as to amount practically to a direct tax. For the people were obliged to buy each year from the management of the monopoly an amount of salt determined in each case by the size of the family. There was a similar "salt conscription" in Germany. Thirdly, there was the tax on tobacco.

SEC. 3. In England¹ we find in Anglo-Saxon times three principal taxes: (1) The ship-geld, a tax imposed on each shire, in proportion to the number of hundreds it contained, for naval purposes. (2) The tribute-like "Danegeld" was levied after 991 at so much a hide (piece of land) and, after the cessation of the original cause, was collected by the kings as private revenue. (3) The "fumage," or tax of smoke farthings, a hearth tax. This seems to have been a traditional form of tax with the Saxons.

In Norman times, the feudal character of the gov-

¹ See Dowell, *History of Taxation and Taxes in England*.

ernment was such that it obtained revenues from the demesne, from feudal dues, and from the royal prerogatives so great that no real taxes exist. The Danegeld was levied by the Conqueror as an annual tax, but disappeared after 1163.

With the reign of Henry II. came a more ordered and regular system of taxation. This began with the well-known commutation of the military obligations of tenants. It was due to the continental position of the Angevin kings. The distance at which war was waged and the length of service demanded rendered the military obligations particularly burdensome, and tenants were anxious to commute them. An army of mercenaries, too, suited the king better, as easier to control than the feudal army. Hence arose the commutation of the duty to foreign service into a money payment of two marks, £1 6s. 8d., on each fee of £20, known as the "scutage." Henry II. collected three such scutages, and this tax did not fall into disuse until after 1322. It was practically a land tax, levied each time for a special purpose.

The tallage in England was the tax that was collected from the tenants on the royal demesne on occasions of unusual expense. Those who paid the hidage or Danegeld were generally exempt. Cities and towns not exempt in this way paid the auxilium or aid. The tenants were liable for these taxes up to one-tenth of their goods. In the city of London the tallage was

*Commutation
of military
services.*

The tallage.

treated as a "benevolence." It was superseded after Edward III. by the general taxes on movables.

The taxes on movables began with the "Saladin tithe" in 1188. It was one-tenth of rent and movables paid by all except crusaders. Out of this insignificant beginning grew a system of taxes on movables which finally included all the taxes so far mentioned. Richard I. levied a tax on all ploughed land in 1194, known as the "carucage," from the area upon which it was levied, namely, the amount of land that could be covered by one plough (*caruca*) in a season. After 1224, this was merged in the tax on movables.

The tax on rents and movables, which began, as we saw, with the Saladin tithe, was continued from 1189 to 1334. This was a grant of one-thirteenth in 1207, one-fifteenth in 1225, one-fortieth in 1232, one-thirtieth in 1237, one-fifteenth in 1275. Up to 1283, the method of obtaining the grant was by separate negotiations with each section of the country. But after that date, general grants were made by Parliament and other taxes were discontinued.

Besides these direct taxes, the crown had the privilege of taking "customary" tolls upon merchandise imported or exported. Hence our modern term, "customs duties." These tolls were of the character of licenses and protection money. Their early history is obscure. Be-

fore the Magna Charta they had become so fixed and regular as to call forth the well-known clause of that historical document: "Let all merchants have safety and security to go out of England, to come into England, and to remain in and go about through England, as well by land as by water, for the purpose of buying and selling, without the payment of any evil or unjust tolls, on the payment of the ancient and just customs" (*sine omnibus malis tollis, per antiquas et rectas consuetudines*). In 1275 these "ancient customs," slightly raised, were granted Edward I. by Parliament. The chief duties were on wine imported and wool exported and a poundage on all other goods imported or exported.

From 1334 to 1453 there are a number of changes to note. The fifteenths and tenths were apportioned among the communities, cities, and boroughs, the townships and the demesne tenants, in 1334, and the assessment then made remained the basis of taxation. The tax thus became a fixed charge. It varied in rate from one-half a fifteenth and tenth, to two fifteenths and tenths, as the need for revenues might change. Sometimes no such grant was made. In 1377 Parliament granted to the king a tax of "four pence, to be taken from the goods of each person in the kingdom, men and women, over the age of fourteen years, except only real beggars." This was known as the "tallage of groats." Subsequently a classified poll tax was

The "fifteenth and tenths."

The "tallage of groats."

employed, in which an attempt was made, by the arrangement of the payers into classes and a gradation of the rates, to get a larger return by taking advantage of the greater wealth of certain classes. In 1379 this yielded £25,000, which was only slightly more than the previous tallage of groats. The clergy were included in both these taxes. After the peasant revolt return was made to the fifteenths and tenths. From 1382 the landowners take the whole burden of the old "fifteenth and tenth." In 1435 this was supplemented by a graduated tax on income from lands, rents, and annuities, and offices of freehold. In the reign of Edward III. the customs yielded large returns. They consisted as before of tunnage on wine, customs on wool and leather, and poundage on all other merchandise. The popularity of Edward IV. enabled him to add to his other sources of revenue the "benevolences," demands on the rich for special contributions. "Benevolences." Throughout the history of taxation in England the grant of monopolies of new industries was made a source of income to the government. The multiplication of these under Elizabeth did not yield much revenue, although it gave rise to much discontent.

There is little in the varied application of these taxes that is important as showing the line of development until the seventeenth century. At that time they proved unequal to the task of meeting the growing needs of the treasury. The chief auxiliary

lay in the extension of the indirect consumption taxes. The year 1692 (revision, 1697) saw the establishment of a permanent land tax. *The permanent land tax.* This grew out of the apportionment of the "fifteenths and tenths." It became a fixed charge on land, a real burden, not having, as time went on, any definite relation to the income from land. In 1798 Pitt made this redeemable, a privilege which has been taken advantage of to the extent of removing half the charge from the lands. In its operation it is rather a rent than a tax.

The wars of the period of the French Revolution and the consequent need of revenue introduced the general income tax (1798, 1802, 1803, *The income tax.* 1806). This tax was no departure in principle from the older taxes, although a departure in method. It has been well characterised as a combination of several taxes into a system which has for its aim the proportional taxation of all incomes, with the exemption of a certain fixed sum (digressive). The form which it took in 1803 is the best to study. Two separate acts were passed, the one taxing all incomes from holdings of real estate, rents, and public salaries at the source; that is, so far as possible the tax was deducted before the revenues passed into the hands of the recipient. The second taxed industrial earnings and interest on capital on the basis of a declaration by the tax-payer. The tax began with an income of £60 (later £50), and this amount could be deducted from all incomes below

£150 ; after that the full rate was paid. Each person was required to declare his whole income and could claim reimbursement for any tax stopped at the source if he could show that his total income was below the minimum. This tax, set aside in 1816, was restored in 1842, as a substitute for the indirect taxes, removed in consequence of the demand for commercial freedom. The rate is changed from time to time as the needs of the government change.

SEC. 4. Local taxation in England has been partly independent of royal taxation. England has not followed the continental plan of collecting revenues for local purposes in the form of additions to the national taxes. While the weight of national taxation fell upon customs duties, excises, and certain direct taxes, measured roughly by income, local taxation was based exclusively upon revenues from real estate. The prototype of all local taxation was the poor rate. Previous to the reign of Elizabeth local activities were of such a character that they could be discharged from feudal dues. In the manorial villages and the boroughs with semi-feudal guild, and close corporation governments, which owned landed property, feudal incomes paid the few public expenses. But the removal of the monasteries, hospitals, and other charitable foundations, threw upon public charity a number of well-developed paupers ; and the rapidly changing character of industry and

*The poor rate
the prototype
of local taxes
in England.*

of economic life constantly gave rise to the problem of what to do with the unemployed, who at times became very numerous. The result was the famous poor law of 1601. The principle of the tax for the support of the poor had been of slow growth. In the reign of Henry VIII. the giving of alms was prohibited, and collections for the impotent poor of the parish were required to be made in each church. In 1547 the Bishops were authorised to prosecute all persons who refused to contribute for this purpose, or should dissuade others from contributing. In the fifth year of Elizabeth the Justices of Peace were made judges of what constituted a reasonable contribution for this purpose. After 1572 regular compulsory contributions were levied. Out of a purely voluntary contribution then, there emerged in two-thirds of a century a compulsory tax. The basis of this tax was the annual rental value of real property. The tax was collected not from the owner but from the occupier. Most of the other taxes for local purposes which have developed in England since then are of the same general character. They are too numerous to mention here. Besides the direct taxes, there were a few indirect ones, market dues, road tolls, coal and wine duties.

SEC. 5. In the American colonies we *Peculiar conditions in the American colonies.* meet with entirely new conditions. Public needs were simple and few, and were mostly local in character. Customs duties were for the most part controlled by the mother country in

the interests of her general colonial policy. So the colonists were driven to other forms of taxation. Practically free trade in land existed. Land at a known selling value early formed a large part of the property of each citizen, and differed in no essential particular from his other property. There were in some colonies, to be sure, charges of a feudal nature known as quit rents, which were a recognition of the king's interest in the land.

Quit rents.

These never became of fiscal importance, and never developed into taxes. Nor do they seem to have ever seriously modified the essentially free character of land-owning, since they were so irregularly and meagrely collected. They were "acknowledgments His Majesty receives of the People's Tenure and Subjection."¹ At times they developed into an apparent tax on certain lands. They seldom formed a part of the revenues of the colonial treasuries, being generally payable to the king.²

Just as there were three different forms of government among the colonies, so there were in the beginning three different tendencies in *The New England tax on property and faculty.* taxation.³ New England began with a tax on property and faculty. The General Court of Massachusetts laid down in 1634 the following principle: "In all rates and public charges

¹ Spottiswood Letters, quoted by Ripley, *Financial History of Virginia*.

² See Wood, *History of Taxation in Vermont*, p. 13. Also Schwab, *History of the New York Property Tax*.

³ Cf. Seligman, *Essays*, pp. 19 ff.

the towns shall have respect to levy every man according to his estate, and with consideration all other his abilities whatsoever, and not according to the number of his persons.”¹ Later, however, poll taxes were used, and the general property tax was extended to cover property in the process of acquisition, or the earnings of labour. In all the New England colonies the resulting system was practically as follows: Each person was to contribute as he was able. Ability was measured, first, by property, real and personal; secondly, by the person himself; thirdly, in the case of *The New England system.* wage-earners, merchants, and others, by earnings. With a few notable exceptions, as in the case of lawyers, the third measure of ability gradually fell into disuse. It has been repeatedly pointed out² that the New England people had the habit of saving. All earnings were soon turned into property. So that the demands of justice were fully met by the general property tax and the poll tax. In addition to these direct taxes, there were a number of indirect taxes, “imposts,” some collected in the form of licenses, and many as excises.

In the Southern colonies, of which Virginia will serve as a model, the first taxes were the poll taxes. “Personal responsibility,” says Mr. Ripley, “was

¹ Massachusetts Records, quoted by Douglas, *Financial History of Massachusetts*, p. 18.

² Walker, “The Bases of Taxation,” *Pol. Sci. Quar.*, Vol. III.

thus the basis of taxation at first, but as the burden of taxation became heavier this liability was partly transferred to real estate."¹ This transfer of the burden to real estate began with the practice of making the personal tax a lien upon the property of absentees, or of persons dying before the payment of the tax. The general property tax in a form like that in use in New England did not exist in Virginia before the Revolution. The grossness of the poll tax was modified by some reference to the different kinds of property owned. In consequence of the failure to develop a good system of direct taxes Virginia resorted to indirect taxes, export duties on tobacco and hides, import duties on liquors and slaves, and some general tunnage duties forming the main features.

The third or central system is fairly represented by New York. There, under the West India Company, 1621-1664, taxation first took the form of moderate indirect taxes on goods imported and exported and imposts on the consumption of beer, wine, and spirits. It was after the passage of the colony into the hands of the English that attempts were made to develop the property tax. The actual existence of this tax begins with the formation of the Assembly after 1683.²

In all parts of the United States after the Revolutionary War the main reliance for local revenue was the general property tax. The commonwealths, as such, had little need for revenues until after 1840. In the formation of the Union indirect taxes were made the prerogative of the federal government, so that the commonwealths had to resort to other means. The character of direct taxation in the United States since the formation of the Union will be treated in the next chapter. The differences in the forms of taxation in the different parts are due both to political and economic differences.

CHAPTER V

THE DEVELOPMENT OF TAX SYSTEMS SINCE THE
INDUSTRIAL REVOLUTION

SECTION 1. The trend of the development of taxation was abruptly changed by the industrial revolution at the close of the last century. On the one hand, the development of constitutionalism, vesting, as it did, the control of the purse in the people, and especially in the tax-payers, had the inevitable effect of changing the ideas underlying the tax systems. New ideas as to the justification of taxation developed, and with them a tendency to seek new measures of taxation. On the other hand, the rapid increase in wealth, the growth of new forms of wealth, such as invested capital, the birth of new kinds of property, as the many kinds of credits, and the rapid change in the distribution of wealth among the different classes in the community,—all of these and other similar causes led to the constant extension of taxation to the new forms. Old taxes which were well suited to certain simpler conditions of society become under new conditions unjust, and give rise to dissatisfaction, to many attempted and some accomplished reforms. These

*Changes in
taxation due
to the indus-
trial revolu-
tion.*

reforms in turn prove no more satisfactory in the long run, for the conditions they were intended to meet change again.

Just as the attention of economists was chiefly directed to the study of productive agencies during the first three-quarters of the century, so the general tendency of the same period in finance may be broadly charac- *Taxation of the agents of production.*
terised as an attempt to compel the different agencies of production to contribute to the support of the government. It is claimed that economists have, during the last two decades, turned their attention more to the consideration of questions of distribution, and it is certainly true that the most recent tax reforms have been in the direction of securing a better division of the burden among the sharers of the new wealth rather than *Taxation of the shares in distribution.*
among the producers thereof. Subordinate to this tendency are various proposals and attempts to alter the distribution of wealth by the use of the taxing power.

The demands upon the revenues increased vastly during and immediately after the period of war which followed the French Revolution. Large debts had been accumulated; great armies and navies claimed support even in times of peace. *Effect of transition to a "money economy."*
New functions were being thrust upon the governments. Moreover, the new economic era demanded the payment of all charges upon the State in money and necessitated the col-

lection of revenues in money. The old feudal receipts and services became more and more inadequate; new industrial receipts were, in general, not calculated to be much larger than the sums necessary to support the service or institution which furnished them. Consequently, taxation on an ever increasing scale becomes the basis of all State finances. Taxation is no longer regarded as a temporary expedient to meet passing and extraordinary needs. It is admittedly a necessary and permanent policy.

The doctrine of political equality when generally accepted leads to a demand for universality and equality of taxation. The difficulties that arise are no longer as to the justification of taxation in general, but as to the justice of certain forms and measures of taxation. The main question is, what is equality, and what the best method of attaining it. The methods and direction of reform were necessarily prescribed by the constitutions of the various countries and differ much from land to land. Different economic and social conditions have also an inevitable effect. Among the constitutional features that determine the direction of taxation the following may be mentioned. First, federal governments have generally been excluded from the field of direct taxation. The central governments of the German Empire, Switzerland, and the United States depend for revenues

Effects of political equality.

Federal governments resort to indirect taxes.

from taxation on customs duties and internal excises. The sense of loyalty to the central government is inferior to that to the commonwealth governments so far as willingness to contribute directly to its support is concerned. The partial concealment or at least lack of prominence of the indirect contribution permits of its collection without calling the attention of the contributors forcibly to the fact that they are taxed by a new authority. Just that advantage of partial concealment in this tax which appealed so strongly to the monarchies, before the birth of political consciousness on the part of the people, appeals to the federal governments. At the same time the practical necessity of uniform rates over the whole country, which arises from the fact that these taxes disturb the economic balance of industry and commerce, and the greater ease of administration with a larger territory and a single boundary, make it advisable to put all of them in the hands of the central organ. It was the latter considerations in regard to custom duties that led to the establishment of the Zollverein and eventually of the German Empire.¹

On the other hand, the different States of which the federal governments are composed have shown themselves inclined to restrict their taxation to the

¹ See Bowring's Report on the Prussian Commercial Union, *Parliamentary Documents*, 1840, Vol. XXI., pp. 1-17. Reprinted in Rand, *Economic History*, p. 170. Also Legoyt's *La France et l'Étranger*, Vol. I., pp. 250-255; *ibid.*

direct taxes, leaving all but a few of the indirect ones to the central governments.

But this separation of the assessment of direct and indirect taxes between different authorities has been productive of great difficulties. For it is impossible to assess any tax justly and equally without reference to the other burdens already imposed on the contributors. It would seem that the demands of justice which dictate that the whole system of taxation should work toward a definite and single purpose, will necessitate either the co-ordination of these forms or the placing of both of them in the hands of the same authorities. The proper co-ordination of all taxes is hard to accomplish when the taxing power is in different hands. This is one of the hardest problems of American taxation.

The development of direct taxation will now be traced in detail by reference to some of the more important countries. Indirect taxes cannot properly be said to have undergone any process of development. Many changes have, indeed, been made, dictated by different economic theories and purposes. But it has been simply a flux backward and forward. Sometimes ulterior aims, as protection, have been abandoned and strict fiscal principles allowed sway. In those cases we find a simplification and a decrease in the number of articles taxed. But no general principles have been developed.

SEC. 2. Probably the most thorough attempts to

reform taxation in accord with clearly recognised principles of theoretical justice have been in Prussia. That country has taken advantage from time to time of the advice of men of science. It has been doubly happy (1) in having a goodly number of unpartisan financial scientists to draw upon; (2) in being able to draw upon them for advice, either by counting their pupils among its fiscal officers or placing the scientists themselves on its tax boards and commissions. It has been able to make changes with a broad conservatism that looked toward the gradual realisation of accepted ideals. With characteristic visionary eagerness, France has several times started out to obtain at a single bound some new ideal, but has each time fallen back upon forms and methods but little better than those in vogue before. In England, special difficulties and objections have been met with little reference to any general plan. The result has been a steady approach to a better state of affairs, with only an occasional intensification of existing evils, due to the attempt to cure symptoms rather than to seek the underlying causes of the trouble. In the United States there have been spasmodic and ill-directed attempts at the removal of a few clearly recognised abuses; and without any consistent attempt to change the system, the result has been a decided modification. The general failure of

Prussia made use of men of science.

Little advance in France.

England removes special faults.

No consistent reforms in the United States.

the property tax to reach personal property gave rise at first to vigorous efforts to extend and sharpen the methods of assessment. These attempts failing, other methods of reaching the mass of personal property were devised, which have resulted in a partial change of system wherever they have been successful.

SEC. 3. The most instructive country to study is Prussia. The line between the old and the new may be drawn at the reforms of Stein and Hardenburg in the forms of land tenure. These reforms *Establishment of free trade in land in Prussia.* may be regarded as having been accomplished in 1811. Briefly stated, their result was to abolish personal serfdom, dissolve the feudal partnership between tenants and proprietors, and establish free trade in land.¹ Although these reforms had to do mainly with land, and although the accompanying edict of 1810 promised speedy reform of the land tax on the basis of a new survey, or *cadastre*, nothing material was accomplished in the reorganisation of this tax until 1861. In that year the land tax was re-
The land tax. arranged for the entire kingdom on the basis of a new and rapidly executed survey. Some twenty different provincial land taxes, with upwards of one hundred minor variations, which had

¹ Seeley's *Life and Times of Stein*, Vol. I., pp. 187-297. Morier, "The Agrarian Legislation of Prussia during the Present Century," in Probyn [Editor], *Systems of Land Tenure in Various Countries*, pp. 306-316. See Selections in Rand.

existed before that time, were merged into an apportioned tax upon the net product of each piece of land as given in the *cadastre*. This tax recently yielded about 40,000,000 M. annually.

The reforms which preceded this were those of the indirect consumption taxes, out of which finally emerged the personal class tax. The *Consumption* edict of 1810, which was referred to *taxes transformed into* above as promising a reform of the land *personal taxes*. tax, seriously attempted to remove inequalities by destroying many feudal exemptions and privileges, and removing local differences. A general scheme of consumption taxes on necessities, of which the excise on meal is a type, was planned for city and country alike. It was, however, immediately found that the meal tax was hard to collect in rural parts. As early as 1811, therefore, a poll tax of one-half thaler from every person over twelve years of age was substituted for the meal tax in all places except the larger towns. In 1820 this tax, still applying to the same places, developed into a classified poll tax; *i.e.* all persons were grouped according to rank, profession, and general prosperity, into a few classes, which were then taxed *per capita* at different rates for each class. Somewhat modified the next year, so as to make twelve *The class tax.* classes, in groups of three each, and with rates which ranged from one-half thaler to 144 thalers, and covering all persons over fourteen years old, this tax endured thirty years. As before, this tax

did not extend to the large cities, where the excise on meal and meat was regarded as placing the same burden on the people. Such a remarkably clear perception of the fact that indirect taxes are practically the equivalent of direct taxes in the individual burden they impose is not often met with in fiscal history.

In 1851, this tax was changed in order to make room for the introduction of an income tax on all persons having an income of over 1000
The income tax. thalers. Those persons whose incomes were below this amount were taxed in the large cities by the meal and meat tax; in the country and in small towns, by a class tax, like the old one, with rates ranging from one-half thaler to 24 thalers, according to the supposed income. Persons living in large cities who paid the income tax were allowed to deduct 20 thalers from their income as compensation for the meal and meat tax they were supposed to have paid. Later reforms removed these gate excises except for local purposes. As the income tax forms a special topic in a later chapter, we will not at present follow the details of its development and reform. It is sufficient to say that it was a progressive tax on the income of every person.¹

When the land tax was reformed in 1861, the building tax was separated from it, having been until that time a part of it; and all old taxes of

¹ See Chapter IX.

a similar sort were merged in the new one. This tax is assessed in the cities according to the rental of the buildings, and in the country according to the size of the lands connected with the houses, and other characteristics. *Building tax.*

One of the reforms that was made after the peace of Tilsit to strengthen the weakened economic resources of the country was the establishment of general industrial freedom. Naturally, such a change would have been regarded as a failure from the standpoint of the statesmen of the times, if it could not be made to yield a revenue to the treasury; so the new industries were *Industry tax.* burdened with a new tax. This tax, which was very weak, and which, wisely, perhaps, failed to meet all the new forms of industry which came into existence, was subjected to a thoroughgoing reform in 1891. But it was at that time transferred to the local governments. Capital invested and some of the permanent features of each business form the basis of this tax.

The Prussian system, as it existed before the great reforms of 1893, may now be seen as a whole. It consisted of two parts: (1) There was a group of three complementary taxes upon the produce of property and capital, — the land tax, the building tax, and the industry tax; (2) there was a system of personal taxes culminating in an income tax. *Summary of the Prussian system before the recent reforms.* The former group, true to the economic tenets of

the first three-quarters of the century, taxed the productive agencies. The latter, although it originated as a consumption tax, aimed at taxing the shares in distribution. Thus the older consumption taxes, which were originally assessed without any very clear idea of what the justification was, but were used because productive of large revenues, yielded to new taxes supposed to be more fairly in accord with the modern system of distribution.

We are now in position to see the significance of the great reforms of 1893 (all of which went into effect in 1895), made under the leadership of *Finanzminister* Dr. Miquel. These reforms place Prussia far in advance of all other countries in the theoretical perfection of her tax system.¹ The income tax, which has long been correctly regarded as the foundation of the Prussian tax system, was subjected to a thorough reform in 1891.² It was strongly urged at that time that income from property represented a far higher faculty, per unit, than income from labour and personal exertion, and, therefore, that a perfect system should contain two kinds of progression: one that taxed larger incomes more heavily than smaller ones; another that taxed incomes from property more heavily in proportion than incomes from labour. It was felt that the existing produce taxes (*Er-*

¹ See Seligman, *Essays*, pp. 330-339. References to larger and more detailed statements are given there.

² See Chap. IX.

tragsteuern), the land, building, and industry taxes, failed to accomplish this end. Hence one of the reforms of 1893 was the surrender *The general* of these taxes as royal taxes, and the *property tax.* initiation of a general property tax as supplementary to the income tax. This tax, which can only be properly understood when its supplementary character is held in mind, is arranged as follows:

The tax is one-half per mill on the lower limit of the class within which the property falls. The classes go by stages of 2000 M. from 6000 M. to 40,000 M., of 4000 M. up to 60,000 M., of 10,000 M. up to 200,000 M., and above that of 20,000 M. each.

Thus:

PROPERTY.				TAX.
	Up to	6,000 M.	. . .	exempt.
From	6,000	" 8,000 "	. . .	3 M.
	8,000	" 10,000 "	. . .	4 "
	10,000	" 12,000 "	. . .	5 "
	20,000	" 22,000 "	. . .	10 "
	40,000	" 44,000 "	. . .	20 "
	60,000	" 70,000 "	. . .	30 " etc.

Above 200,000 M. the stages are 20,000 M. each, and the tax increases 10 M. in each stage.

This tax being supplementary to the income tax accomplishes the result of imposing a differential rate on funded income as against unfunded income.

The abandonment by the State of the three old taxes on land, buildings, and industry rendered the

reform of local taxation possible. As has already been said, the proper co-ordination of all tax burdens *The reform of* is one of the chief problems of modern *local taxation.* tax reform. With the exception of the beer taxes, and the meat and meal taxes still used by some of the cities, local taxation in Prussia is mainly direct. Most of it, until 1895, took the form of additional percentages to the rates of the royal taxes. In some cities there were important special local taxes, like the house rent tax in Berlin. Prussia, also, grants subsidies from the royal treasury to the local bodies for special purposes. But the symmetry of the national system was somewhat destroyed by these additional rates. Such additions to the income tax were especially intolerable. Real estate is, moreover, a particularly good basis for local assessment. It cannot evade the tax, and it is the recipient of particular benefits from good local government. The same is true of businesses of a local character, although it is not safe to let the rate vary from place to place. Hence these three taxes were handed over to the local bodies. At the same time the attempt was made to regulate all other sources of local revenues.

The Prussian system as it now stands comes nearest to the realisation of the taxation of faculty of any in the world. The chief difficulties that have arisen are those of assessment. The progressive rate gives rise to a special incentive to the concealment of larger incomes, and not even the general excel-

lence of Prussia's administration has been preventive of under-assessment.¹

SEC. 4. In France indirect taxation has probably found a higher development than anywhere else. Some of the main taxes are on the consumption of wine, spirits, beer, sugar, salt, tobacco, etc.; there are also the *octrois* or gate duties collected by some of the cities as a means of contributing their share of some of the direct taxes to the general treasury. There are also

High development of indirect taxes in

France.

the taxes on acts and transfers, which will be treated under fees, since they assume a public service, and the customs duties. Not peculiar to France, but receiving a high development there, is the mode of collecting a tax on consumption by a monopoly of the manufacture of tobacco in the hands of the government. The imperative necessity under which France has laboured all through this century of continually increasing her revenues, and the danger of making the burden unbearable if thrown upon the existing direct taxes, as well as the desire on the part of the legislators of concealing so far as possible the actual burden, lest an impatient constituency rebel, accounts well for the relatively high development of indirect taxation. The preference for indirect taxes as the main reliance of the public revenues argues, however, a low stage of political ethics.

¹ See the revelations of the Bochum investigations, quoted by Wagner in *Schanz Finanzarchiv*, XVIII. year, Vol. II., pp. 107, 108,

The more highly developed the consciousness of citizenship and membership in the State, the easier it is to make direct taxation effective.

Direct taxation in France dates in its present form from the Revolution. All the taxes of the ancient monarchy were abolished at that time and a fixed scheme of taxes on revenue-yielding property substituted. This system of direct taxes has

The members of the system of direct taxes. four chief members: (1) the tax on real estate; (2) the tax on persons and dwellings; (3) the tax on doors and windows; (4) the tax on business. Supplementary to this system are a number of taxes classed officially as assimilated to the direct taxes. These, so far as they flow into the State treasury, are: (1) the tax on mines; (2) the charges for the verification of weights and measures; (3) the tax on goods in mortmain falling on the property of the *communes*, hospitals, churches, seminaries, charitable institutions, etc.; (4) the charges for the cost of inspection of pharmacists, grocers, druggists, and herbists. Of these numbers 2 and 4 are practically fees, numbers 1 and 3 are merely definite kinds of real estate taxes.¹

The real estate tax, the personal and dwelling tax, and the door and window tax are apportioned taxes. The real estate tax, which is a combined

¹ The official classification of taxes in France is very complex, as the example above given shows. In order not to confuse the student it will not be followed further in this work.

land and building tax, is apportioned upon the basis of a very elaborate survey and valuation completed in 1850, and carefully kept up. These taxes are apportioned in successive steps *The apportioned taxes.* first to the *departments*, then to the *arrondissements*, and then to the *communes*, by the several legislative bodies, and finally divided among the individuals in each *commune* by a "*conseil de repartition.*" The tax on persons and dwellings, also apportioned, is a poll tax, with an attempt at gradation according to the ability supposed to be indicated by the rent of the building occupied. It consists of two parts: (1) the amount of three days' wages of labour at from one-half to one and one-half francs *per diem*; (2) the tax on the rent of the building occupied as a private dwelling. The cities of Paris, Lyons, Marseilles, and a few others raise their shares of this tax by the means of duties on goods brought into the city, *i.e.* *octroi*. The door and window tax is an apportioned tax rated according to the number of windows and doors in the houses. It was intended to supplement the personal and dwelling tax, but it is really an addition to the real estate tax. It is paid by the owner and he is allowed to shift it if he can to the tenant.

The industry tax, *contribution des patentes*, unlike the other members of the system, is not apportioned but proportioned. It is intended to reach the bulk of the personal property, and in a rough way covers income from certain kinds of labour. Originally it

was assessed in proportion to the value of the location of the factory, store, or workshop occupied by the industry. Now it is assessed upon *The droit de patent.* some elaborately constituted classes, in rates which vary with the size of the community in which the business is done, and the rental of the place of business. It includes all kinds of commercial and industrial enterprises and occupations, large and small, and also the liberal professions, when not exercised in behalf of some already taxed business enterprise. The agriculturalists are exempt.

Direct taxation in France may be summarised as falling mainly on the agents of production and the sources of wealth.

SEC. 5. The English system of taxation can be very briefly treated here, because the principal component parts will be discussed in detail in later chapters. What is necessary here is to give an outline of the system as a whole. The greatest change in the British scheme of taxation within *The reforms of 1840-1850.* this century was the elimination of the protective principle from the customs duties,—and indirectly from the excises also,—brought about in the period from 1840-1850, by the abolition of the corn laws and the agitation leading thereto. The consequent simplification of both the import duties and the excises rendered it possible to manage them simply as a source of revenue with a view to obtaining relatively larger sums. The customs duties, the entire tariff of

which now contains only 40 rates, and the somewhat more numerous excises and stamp duties, pay one-half the total annual revenue. The property and income tax, which was restored in 1842 and has since been the variable or elastic element in the system, will also receive special attention in another chapter. In-
The property and income tax.
asmuch as this famous property and income tax is a system, in itself, of five taxes which are calculated to fall upon the chief sources of wealth, it complies, in a way, with the requirements of universality. Its rate is digressive, so that it attempts to comply with the requirements of justice. It may be looked upon as the complete system of direct taxation. Outside of the system there are two remnants of older taxes which are anomalies and destroy, somewhat, the logic of the system. This lack of any logical reason for retaining them does not necessarily form any good reason for abolishing them. They give rise to no serious complaint, they are old and have been in the main capitalised, so that they form no real burden at present. They are the land tax of the eighteenth century, which is now a redeemable rent charge, and the house duty. This latter developed out of the hearth tax of 1662. In 1688 it had been replaced by a window tax. In 1778 a tax on the annual rental
The house tax.
was added to the window tax, and finally after 1851 this tax on the rental value was left to stand alone.

There is still another tax which supplements the property and income tax, and that is the inheritance tax. The most recent changes in these *The inheritance tax.* inheritance taxes, — “death duties,” — which have existed in England since 1694, will receive attention under another heading. The important thing to note in this connection is that these taxes have introduced the principle of progression very extensively into the tax system of England.

The English system as it now stands, consists (1) of the customs and excise duties, (2) of the so-called property and income tax, a digressive tax upon five kinds of income, (3) two older taxes, the land tax and the house tax, (4) a graduated inheritance tax.

The different authorities that have had the power to levy local rates in England are very numerous. The whole system is very complex. The different rates, each going by the name of the authority that levies it, or the purpose for which it is collected, are mostly upon the same base, namely, the annual rental of the various tenements. They are generally levied upon occupiers. In the case of tenements of less than £10 annual value, the difficulty of collecting from the occupier is so great that the plan of making the landlord advance the tax has been adopted. He then shifts it to the occupier. The recent reforms of county and municipal government in England have resulted in a simplification of local rates.

SEC. 6. Like the English, the American system can be but briefly treated here, since many of the

taxes will receive our attention in subsequent chapters. The principal federal taxes have been customs duties and excises. The States, or commonwealths, have confined themselves rather closely to direct taxes, as have also the municipalities. Down to 1840, commonwealth taxation was very meagre. Many of the States attempted to get along without recourse to taxation at all, depending for revenues upon the sale of lands, fees, and other sources.

The evolution of taxation in this country during this century has resulted in little advance. Indeed, it has been to make confusion thrice con- *The absence of sound principles.*
founded. Not only has difficulty been found in adjusting the spheres of the different taxing authorities, but no sound principle, indeed scarcely any principle at all, has been followed. Before the Revolutionary War the general property tax, whose origin we have already seen, answered the requirements of justice and equality fairly well. As has been frequently remarked, the American people were a saving race. As fast as they created wealth they turned it into property. The forms of property were, even when not immovable, tangible and unconcealable. Real estate formed the mass of it. Movable property consisted of furniture, farm utensils, and cattle. There were few stocks or bonds, or other forms of credit in which to invest wealth. Among such a people a tax levied on property that was easily ascertainable answered all the requirements.

But as intangible personal property increased, as opportunities for investment multiplied, it became

The property tax not "general." impossible to make the property tax "general." It became a tax on real estate except for the few conscientious

persons who declared their personal property. The commonwealth legislatures made half-hearted attempts to sharpen the procedure of assessment. But little or nothing was gained in that direction.

Prompted by a wave of popular excitement, or a feeling of bitterness toward certain classes of capitalists, the legislatures have, from time to time,

The corporation taxes introduce a new principle. attempted to reach personality by taxing the corporations in which the untaxed funds were invested. The resulting corporation taxes worked some slight improvement.

Under the existing conditions they cannot all be shifted. They supplement the general property tax very effectively. Sometimes, the legislatures

Taxation of mortgages. have attempted to tax mortgages, as if they were a part of the property on

which they rest. As mortgages have to be recorded in order to be legal, it is possible to get at the full value. In some commonwealths, then, the mortgagee is taxed on his interest in the property and the owner is exempt to that extent. In California, where this plan has been most extensively tried, the result has not been at all what was desired. The only effect has been to raise the rate of interest on mortgages by the amount of the tax plus from one-

fourth to one per cent. That is, the mortgagees have succeeded in shifting the burden of the tax to the real owners with a handsome addition for their trouble. Such a shifting is always possible when any one form of capital is taxed leaving other forms untaxed, either because they are exempt or because they escape the tax. So the American system remains what it has been since 1840,—a regressive tax on real estate, supplemented in part by corporation taxes in some commonwealths, and by a few inheritance taxes. It is a system condemned by every scientific writer and impartial statesman, but retained as the only source of revenue.

The difficulties which have prevented persistent attempts at reform remain, and it is hard to see how they can be overcome. No one com-
monwealth can afford to pursue personal property with so much vigour as to act-
ually impose a tax on all of it. Only concerted action could accomplish this. Capital is sufficiently mobile to move easily from commonwealth to commonwealth, and if compelled to bear its fair share of the burden in one and not in another, it will surely migrate. Legislators are extremely desirous of attracting capital and very wary of repelling it. The owners of capital cannot be taxed personally. They change their residence from city to suburb and even to unfrequented rural parts on the slightest increase of local taxation and move from com-

*The difficulties
in the way of
reform.*

monwealth to commonwealth with equal facility. Residence too is a matter of intention, and it is easy if personal taxes are proposed to plead residence in another commonwealth. Concerted action being practically impossible, the tax-dodger is safe.

But while the present system is very bad, it has been tolerated in the past, and arouses less discontent at present than might be expected, because it falls mainly on the receivers of economic rent. The value of land in many parts of the United States has increased very rapidly and is still increasing steadily. So that in those parts, while the taxed owner feels the burden severely, he consoles himself with the thought that he is largely or wholly reimbursed by the increased price which he hopes to get for his land. The general practice, too, of assessing real estate at a fraction of its value, even though so universal as to work no actual lessening of the burden in any individual case, tends to stifle murmurs of discontent. For the owner secretly congratulates himself on not having to pay on all of it,—an illogical basis for self congratulation, to be sure, but still not infrequently effective. The same person, too, is not infrequently the owner of taxable personal property which he conceals, and he is less uneasy about the tax on real estate so long as he is able to save the other.

Another reason for the absence of a concerted movement of real estate owners to lessen the burden

arises from the fact that the real estate tax is a real burden on the property, and shifts itself by the process of capitalisation. For the new purchaser gets his property at a lower price than he would have to pay if the tax had not been imposed. The frequency and ease with which real estate changes hands gives constant occasion for this capitalisation of the tax. Every real tax, when not a part of a well-organised system which taxes every kind of property or all receivers of wealth, can be shifted in this way. It becomes a rent charge on the property to which it is thus attached. A dim perception of this, and a possible realisation of the fact that a reform of the tax system might transform this tax into an actual burden again, may lie at the bottom of the indifference with which the average land owner views proposed reforms.

All of this selfish indifference is, of course, mistaken. It defeats its own ends. The burden of taxation is only light when properly adjusted to all the shoulders. The serious effects of an unjust, unequal, and ill-arranged system of taxes upon the economic forces of the country has been treated elsewhere. The property tax forms the subject of a special chapter.

We have spoken merely by courtesy of an American *system*. As a matter of fact there is none that is worthy of the name. Federal authorities tax with no reference to commonwealths and municipi-

palities; commonwealths and municipalities, without reference to federal action. Municipal taxes are, however, generally adjusted to the existing commonwealth taxes, but only in such a way as not to make the resulting burden appear too large. Their efforts in this direction have only served to intensify the existing inequalities.

Entire absence of system.

CHAPTER VI

EXCISES

SECTION 1. Generally speaking, indirect taxes are older than direct taxes. They are suitable to a more primitive organisation of society. Hence it will not be amiss to treat them before we analyse the direct taxes. By far the larger part of the indirect taxes are on consumption (*Aufwandsteuern*). Most of the taxes on consumption fall under one or the other of two heads: they are excises or customs duties. In the United States the excises are called internal revenue taxes. Excises may be defined as all those taxes levied within a country on commodities destined for consumption. Customs duties fall on commodities as they enter the country. In their effect on the economic condition of the country and on the tax-bearer they are practically the same. In both cases the persons who first advance the taxes are generally supposed to reimburse themselves from the persons to whom the wares are sold. In both cases it may be true that only a part of the funds taken from the tax-bearer flows into the treasury. For both of them enable producers who escape, or whom it is not intended to

*Comparison
of excises and
customs.*

tax (as the home producer in the case of a tax on imported commodities), to collect on each piece of goods sold a tax in the form of a price higher than he could otherwise obtain, the amount of which goes into his own pocket. Sometimes this subsidising of certain producers is intentional, sometimes only accidental. In any case the ultimate effects which will result from such an interference with the ordinary currents of trade cannot be fully traced. It is very seldom that excises have been intentionally used to change the movement of economic life. But customs duties have regularly been used for that purpose. Excises sometimes have, to be sure, been used to influence moral re- social life, to lessen the consumption of forms. certain commodities the use of which is regarded as injurious to the individual or dangerous to society. But the object, in that case, is social, not economic.

There used to be a large number of the so-called direct consumption taxes. A few of these still survive. They are direct in the first sense of that term, but not in the second. These direct taxes on consumption are either remnants of the older taxes on movables, or arose from the attempt to frown on the use of luxuries. They differ from excises in that they are levied on the consumer and not on the person or persons who supply him with the commodities. They are to-day few in number and of little fiscal

importance. The chief instances in modern times and the most universal are the dog taxes. There are in England similar taxes on guns, carriages, armorial bearings, and men servants. In the United States watches have been made contributory in this way. Plate, houses, clocks, hair powder, and a great many other articles have been taxed. It is regarded as just to make articles of luxury the subjects of taxation because their use is supposed to be evidence of ability to pay. The tendency now is to leave the administration of direct consumption taxes to the local bodies. They are sometimes combined with police regulative laws and are assessed as a means of enforcing those ordinances. This is the case with the dog tax in America.

SEC. 2. It is the excise tax in all its forms that has displaced the direct consumption taxes. The distinguishing feature of this tax is that some resident seller of an article, whether produced in the country or abroad, or the manufacturer of such an article, advances the tax either during the process of its production or at some time before it reaches the consumer. The main purpose of the excise is to obtain revenue, but the ideas underlying the sumptuary laws, and the desire to use taxation as a means of social and moral reform have dictated some of these taxes or at least the selection of the commodities to be taxed. The fact that the consumption of certain articles like spirituous liquors,

Some excises have the same purpose as sumptuary laws.

tobacco, and playing cards is condemned in itself, and that such articles are regarded as unnecessary luxuries has led governments to disregard, or, indeed, to favour, the repressive tendency of the tax upon the use of them. It is felt that in case the tax should lessen the consumption, the gain to the community in moral and social well-being would more than offset the loss to the treasury in revenue. Moreover the consumption of such articles is not, it has been found, liable to serious diminution on account of the tax, unless, as in the case of the French tax on tobacco, it is very high.

In the seventeenth century there was a marked tendency to multiply excise taxes. So strong did this tendency become that not a few able writers advocated a general excise as the most just form of tax.¹ Many of the recent suggestions for the reform of taxation in France are in the same direction. This tendency can be easily explained by rapid multiplication of taxable commodities. It was urged that the ease with which such taxes were shifted ensured in the end perfect justice. It was also often urged that consumption is more or less voluntary, and any one who finds the tax too heavy can avoid it or lessen it by curtailing his consumption of the taxed article. Thus if the taxed articles are not important necessities the contributor has a certain control over his share and can suit it to

An exclusive system of excise taxes would be unjust.

¹ Cf. Cohn, p. 336 ; Seligman, *Shifting and Incidence*, pp. 12 ff.

his means. If the tax is on a luxury, he has absolute control over his contribution. But modern investigations into the character of distribution and consumption would seem to indicate that these views are erroneous. There is no doubt that consumption is a very poor criterion of tax-paying ability. What a man spends is no indication of his tax faculty. There are also some important administrative difficulties. The yield of these taxes is beyond the control of the fiscal officers. *An exclusive system of excises inexpedient.* If more revenues are needed, it is not always possible to obtain them by raising the rates, since a rise in the rate may, in fact, lessen the revenues by lessening the demand for the articles. They are not variable at the pleasure of the treasury. It follows therefore, that a system of excises would be extremely inelastic. But as parts of a system, the elasticity of which is provided for by other elements, they have proved very valuable on account of the relative ease of administration, and the large returns *Used in connection with other taxes.* which they can be made to yield. In England, Russia, and France the returns of the excises and customs duties are about one-half of the national revenues. In Germany the constitution confers upon the Imperial legislature the power to regulate the customs and excises upon domestic productions of salt, tobacco, spirituous liquors, beer, sugar, and syrup.¹ The common-

¹ Burgess, *Political Science*, II., p. 174.

wealths of the Empire do not levy excises on the articles above mentioned except Bavaria, Würtemberg, and Baden. The Empire cannot tax any other articles. In the United States the federal government derives nearly half its revenues from excises and an almost equal amount from customs.

The following principles have been developed as governing the returns obtainable from excises:

Excises on necessities. (1) Articles which are regarded as necessities and which naturally have or can

have a wide consumption, are very suitable under this tax for obtaining large revenues. In this case the operation of the tax is like that of a poll tax. The French *gabelle* is an example. The effect of these taxes, if high, is possibly to curtail consumption and possibly to cause a substitution of other similar articles not taxed. Possibly, too, they may curtail the consumption of other articles by lessening the money available for their purchase. But even with a low rate, these taxes are extremely productive, on account of the large number of contributors. The objection to burdening necessities and rendering the existence of the poor harder, leads, however, sooner or later, to their abolition. These, like the poll taxes, recognise no differences in

Excises on luxuries and comforts. ability. They are, however, good sources of revenue in cases of extreme need.

(2) Luxuries and comforts may be taxed heavily. The general principle is to select those luxuries of the widest consumption as the objects

of the heaviest taxes. Thus alcoholic liquors and tobacco are universally taxed in this way. In the United States they form almost the sole objects. In times of special need it is customary to press the semi-luxuries or comforts into service. Here again, the choice is made of articles of widest consumption ; such as coffee, sugar, silks, chocolate, etc. In most modern excise systems, the heaviest burden falls upon luxuries. In England, where the receipts from excises are 30 per cent of the total revenues, the chief burden falls upon spirits (£15,189,000) and beer (£9,536,000). In France, aside from the *octroi*, the chief excises are on beer, wine, spirits, and tobacco, then on sugar, salt, and playing cards. In Germany, apart from the city gate taxes, they fall upon alcoholic drinks, tobacco, and sugar. There are special difficulties which Germany encounters in the administration of these taxes, due to deep-seated historical prejudices on the part of the commonwealths of the Empire. Moreover, the yield is not as large as it might be because of the bounties on sugar exported. Modern excises are, then, mainly taxes on alcoholic drinks and tobacco with the addition of a few other duties upon playing cards, etc., and in cases of great need, upon a few articles of large consumption.

SEC. 3. By far the most interesting features of the excises are the methods of assess- *Methods of*
ment. These are practically of three *assessment.*
kinds, which may be variously combined: (1) A tax on the producer or seller such that the failure to

pay it deprives the person of the right to sell, and renders him liable to penalty. That is, a license is sold. (2) An impost on each unit of the article. This demands the registration of the dealers therein; and sometimes they are required to give bonds as surety for the payment of the tax. Wherever it is possible, this impost is collected by means of the sale of stamps purchased of the government to be affixed to each package, hogshead, etc., or by means of brands, or other marks affixed by officials who thus receipt for the payment. (3) By the retention of the monopoly of manufacture and sale by the government.

England and America use a combination of (1) and (2). Thus in England every barrel of beer is taxed 6*s.* 9*d.* and every dealer and brewer pays a license besides.¹

	£	s.	d.
¹ Beer, per barrel of specific gravity of 1055 degrees.....	0	6	9
Beer dealers' and brewers' annual licenses:			
Beer dealers, wholesale, not brewers, United Kingdom.....	3	6	1
Beer dealers to sell any quantity, additional (not to be consumed on the premises, England and Ireland)....	1	5	0
Brewers brewing beer for sale, U. K.....	1	0	0
Other brewers, U. K., annual value of house from £8 to £10.....	0	4	0
Annual value from £10 to £15	0	9	0
Retailers of beer, cider, and perry:			
For consumption on the premises, U. K.....	3	10	0
Not to be consumed on the premises, England.....	1	5	0
Retailers of table beer, U. K.....	0	5	0
Retailers of beer and wine, U. K.:			
For consumption on the premises.....	4	0	0
Not to be consumed on the premises.....	3	0	0

In the United States, all internal revenue taxes are payable by stamps. These stamps are pasted upon the packages containing the taxed commodities in such a way as to be necessarily broken when the package is opened. Or else they are pasted up or exposed in the places of business. The table below shows the whole system.

Schedule of articles and occupations subject to tax under the internal revenue laws of the United States in force August 28, 1894 (with the exception of the income tax then in force but since found unconstitutional). From the compilation of 1894:

SPECIAL TAXES.

	Rate of tax
Rectifiers of less than 500 bbls. a year.....	\$100.00
Rectifiers of 500 bbls. a year, or more.....	200.00
Retail liquor dealers.....	25.00
Wholesale liquor dealers.....	100.00
Retail dealers in malt liquors.....	20.00
Wholesale dealers in malt liquors.....	50.00
Manufacturers of stills.....	50.00
And for stills or worms, manufactured, each.....	20.00
Brewers, annual manufacture less than 500 bbls.....	50.00
Brewers, annual manufacture 500 bbls., or more.....	100.00

Spirits are taxed in a similar way and so are the dealers therein. In the case of tobacco the import duty forms the tax on the commodity, and the manufacturer pays a license graded according to the size of his business.

Tobacco manufacturers:

SEC. 4. We may now look at a few characteristic excises. The taxation of salt by means of an excise, collected in the form of a tax on producers, a tax on sellers, the sale of a monopoly to a private company, or state manufacture, is one of the oldest. On account of the nature of the commodity, a necessity for which there is no substitute, and of which poor and rich consume about the same amount, this tax acts practically as a poll tax. With the modern tendency to abolish or at least to lower poll taxes, as unequal and unjust, the salt tax has been largely abolished, or its rates have been so lowered as to practically nullify the returns. France to-day gets only 1,250,000 francs from the salt excises, to which should be added the customs duty, making a total of over 3,000,000 francs. The English salt tax yielded at the time of its abolition only £380,000. The United States war excise upon salt yielded only \$300,000.

The best, but not by any means the sole, example of the tobacco monopoly is in France. This interesting tax scheme began in 1674 under Colbert. It

continued with slight interruptions for over a century as one of the most productive parts of the revenue system. It was leased to a *ferme* *French tobacco monopoly. générale*, who paid the government at the time of Necker 32,000,000 francs annually. At the time of the Revolution the monopoly was abolished, and an attempt was made to introduce a series of taxes on tobacco. But the monopoly was restored in 1810 by Napoleon I., and has continued ever since. Under the present law the culture of the plant is forbidden outside of certain localities. Each year the estimated amount required by the department is apportioned among the different applicants within the district where it is permitted to raise tobacco. Several thorough official inspections of the fields and crops are made, and even the number of plants and leaves is counted to ensure obedience with the regulation which demands the delivery of the whole crop to the government. Tobacco raised for export is similarly watched to see that none of it escapes into the channels of the French trade. The price for each quality is determined by a commission of officials and experts. A part, about one-half, of the supply is imported. The manufacture is carried on in public factories, which employ about 20,000 workmen. The sale is in the hands of some 40,000 petty officials, who receive a percentage of their sales and whose appointment is a part of the party spoils system. The revenues obtained in this way are enormous :

1815	.	.	.	40,000,000	francs.
1869	.	.	.	197,000,000	"
1872	.	.	.	218,700,000	"
1876	.	.	.	262,300,000	"
1880	.	.	.	284,000,000	"
1885	.	.	.	300,000,000	"
1890	.	.	.	315,000,000	"

The prices charged for tobacco are high compared with the prices prevalent in other countries, so high that the consumption is apparently checked thereby, it being per capita less than one-half that of Germany. Austria and Italy have very similar State tobacco monopolies.

SEC. 5. On account of the large returns obtainable from an excise on luxuries, and in view of the fact that any repressive effect of such excises is not felt to be harmful, but is often desired, it is probable that these taxes will be long retained. They are applicable to any luxury the consumption of which is large and of which the production is sufficiently simple or concentrated to allow of supervision. But in general, excises as taxes on expenditure or consumption are unfair. What a man spends is no indication of his ability to pay taxes, and what a man spends on a certain limited list of commodities is less so. When these taxes are made a subordinate part of a system and due allowance is made in the other taxes for the existing burdens, there is less objection to them.

CHAPTER VII

CUSTOMS DUTIES

SECTION 1. Customs duties are taxes levied upon commodities when they cross the national boundary line, or are admitted within a customs territory, consisting of a combination of countries or of definitely limited parts of countries. Unless a city or town forms an independent sovereignty, taxes levied on goods entering a city are not called customs duties, but *octroi* or imposts, and partake of the nature of excises. Duties upon goods passing from province to province in the same country are likewise not customs duties. Neither are tolls or transit duties charged upon goods passing through the country. Such charges are fees for the ostensible or real service of the government in keeping up roads and bridges, maintaining peace, and allowing transit.¹ Customs duties are indirect consumption taxes of practically the same character as excises. Their treatment in a separate chapter is not on account of any actual difference in nature but because of their historical and fiscal importance.

¹ Cf. *Bastable*, p. 513, for contrary view. Bastable does not recognise fees as a separate class. Hence his identification of transit duties with customs duties.

SEC. 2. The oldest forms of customs duties were on exports and imports alike. They arose by analogy from the transit tolls which were *Old customs* customary in the middle ages. Once *duties covered both imports and exports.* in use their fiscal importance was recognised, and it was easy from the standpoint of feudal politics to justify their continuance. Feudalism regarded every act of the vassal as the concern of the lord. If any vassal, or later any subject, found a new means of gain, feudalism imposed on him the duty of contributing a part thereof to the lord or the king. If a subject sold a commodity to a foreigner it seemed to the men of the middle ages that the king's interests were affected, and it seemed right that his permission should be paid for. The export duty is often a sort of compromise accepted for the removal of the prohibition of exportation. With the decay of the older, cruder, mercantile ideas and the advent of a period when national wealth came clearly to depend upon the size of national trade more than on its direction, export duties fell away. It is interesting to note in this connection that England retained until the middle of this century an export duty on coal, supposedly for the protection of her deposits from depletion. *The fall of export duties.* Turkey is now the only country where export duties form an important item of revenue. There the duty is 1 per cent of all exported commodities. Switzerland, Austria, Russia, and Italy have a few export duties upon products peculiar to

their soil, the burden of which is supposed to fall upon the foreigner. France did away with them in 1881 ; Germany in 1873.

Import duties are still very numerous. As a branch of the taxes on consumption, their yield is very large. The German customs duties yield about 27 per cent of the total imperial receipts. Until recently, about half of the United States federal income was from this source ; now it is slightly less. The English customs duties yield 25 per cent of the gross receipts, the French 15 per cent, and the Italian the same.

SEC. 3. Although the fiscal interests are great, yet in every important country except England the receipts from this source are not regarded as of any greater importance than the effects upon the industries of the country. There are then two sides from which these taxes must be studied : (1) From the side of revenue-yielding capacity ; (2) from the side of the " protection " afforded the industries of the country which levies them. While it would be

The purposes of the customs duties both fiscal and political. undesirable to introduce a full discussion of the far-reaching economic effects of protective duties upon industries and commerce in a treatise on finance,

yet a brief statement of these effects and of the main reasons which have led great nations to adopt these taxes is essential to an understanding of their nature. It is as essential to know how and why protective duties are intended to alter the existing

economic conditions, as it is to know how and why the income tax, for example, is supposed to leave them unaltered.¹

SEC. 4. What is the distinction between a protective tariff and a tariff for revenue? It may be briefly stated as follows: A protective *Protective tariff* is a scale of duties so arranged as *iff defined.*

to prevent importation, wholly or in part, and to raise the price of commodities from abroad, the production of which within the country it is intended to encourage. The scale of duties is therefore arranged with a view to the supposed needs of the industries which it is intended to develop. A tariff for revenue, on the other hand, aims to avoid any effect upon industries within the country, and the duties are laid according to prin- *Revenue tariff defined.*

ciples similar to those of the excise, upon articles of large consumption and great tax-bearing capacity. The term "a tariff for revenue only," so current in the United States, is the expression of an unattainable hope. A moment's consideration of the law of international exchange,² namely, that the interchange of commodities between dis-

¹ To refuse, as Bastable does, to discuss protective duties because we believe them "vicious" and "uneconomic" is not scientific. In spite of the condemnation heaped upon them by economists of the old school, the people of many great nations have continued to use them. This fact alone necessarily forces them upon our attention. We must trace the effect and incidence of these taxes as of any others.

² See Mill, *Prin.*, Bk. III., Chap. XVII.

tant places is determined by differences in their possible cost of production in the same place, and not by their absolute cost of production in the separated interchanging places, will reveal the fact that even a very small duty upon a single commodity affects the demand of the country from which that commodity comes for other things, and indirectly affects every commodity manufactured in the country laying the tax. The same is true of an excise. In fact, any consumption tax has far-reaching effects. Strictly speaking, there can be no such thing as a tariff for revenue *only*. What is meant by that phrase is that the tariff shall be so arranged as to yield the needed revenue with the least possible effect on the trade and industry of the country.

It must be noticed that every tariff, even though it contains many protective features, also necessarily contains many duties which are mainly for revenue. Thus in the United States even with high protective duties, the main revenues were obtained from the taxes upon a few commodities. The receipts in 1888, for example, were: from duties on sugar and the like, \$52,000,000; from wool and woollens, \$37,000,000; from iron and steel, \$21,000,000; these three together being more than half the entire receipts from customs duties.

SEC. 5. The protective principle is widely applied in every important existing tariff of customs outside

of England, Holland, Norway, Belgium, Switzerland, and Denmark. This policy is clearly the outcome of national selfishness. The attempt to direct industry into certain lines by artificial means cannot find support in any system of political economy that regards the largest possible world's product as the proper aim.¹

*Protection as
a national policy.*

The object is rather the greatest possible diversity of home products. In so far as this purpose is attained, it is by the process of shutting out competition and allowing the home producer to collect from home consumers a certain amount of support, greater or less, according to the supposed needs of the producer in question. In so far, then, the actual protection afforded is an item of public expenditure. Revenues collected by means of higher prices authorised by law are spent in developing the industry protected. It is in every respect the same as if a subsidy were paid to the manufacturer or other producer, except that the money goes directly to him without first passing through the treasury.²

SEC. 6. We turn now to a treatment of the *tax* character of protective duties: (1) In the first place,

¹ See the article by Professor Folwell on "Protective Tariffs as a Question of National Economy," in *The National Revenues*, a collection of papers by American economists, edited by Albert Shaw, Chicago, 1888. Contrary to the popular opinion as to the views of economists, none of the writers who have contributed to this symposium finds it possible to attack protection on *a priori* grounds.

² See above on expenditure for protection of industry.

it is clear that the more "protection" the duty gives, the less will be the revenues afforded to the

A high protective tariff yields little revenue.

government, and the greater the possible revenues to the subsidised producer.

Absolute protection means the exclusion of the foreign commodity and no revenue to the government. The subsidy that the producer can obtain is determined by the conditions of production; it varies from nothing to the whole amount of the tax according as the cost of production varies above what the cost of the imported commodity would be without the duty. (2) Above a certain point high duties tend to diminish the revenues to the government, and increase the subsidy to the producer, by diminishing the amount of the commodity imported. The point beyond which the

At what point is the revenue yielded largest?

total revenues diminish is ascertainable by a principle similar to that of charging what the traffic will bear. In practice that point can be ascertained by gradually

increasing the duty until it is found that the importation begins to diminish, and stopping the increase of the duty when it is found that the added duty checks more of the importation than the increased duty compensates for. A tariff of customs

The cost of protection is paid by the consumer.

duties arranged throughout on this principle would be a revenue tariff, and if universal would yield enormous sums.

It would, also, contain many protective features. The burden of such a tax would be insufferable.

No such general tariff has ever been enforced. (3) Protection is given only when the price is raised. The subsidy paid to the producer is paid by the consumers within the country. This part of the tax is never shifted to foreigners and generally remains on the consumer. (4) But that part of the tax which flows into the treasury of the government is not always, although generally, paid by the consumer, whether protection is afforded thereby or not. There are a few rare instances in which the tax that forms a part of the government's revenue is shifted either to the foreigner, *i.e.* the producer or the speculator, *i.e.* the importer. These instructive instances may be summed up as follows: The consumer escapes that part of the tax which flows into the treasury on purchases of commodities actually imported: (a) When the amount of the commodity produced in the country laying the tax is sufficient in quantity to entirely supply the home market and to fix the price very close to the cost of production, while the foreigner has at the same time so large a supply that he must enter that market to dispose of it. In this case, if any revenue at all accrues to the government, it is clear that it is paid by the foreigner, who is burdened by the whole tax and may lose more,—more, that is, if his entrance into the market still further depresses the price. The home producer gets no subsidy. A commonly cited example of this is the

The tax actually collected by the government is not always paid by the consumer.

When the foreigner pays the whole tax.

case of rye in Germany in good years when the outside crop is also good. (b) When a new tax is laid

The foreigner pays the tax temporarily. on goods produced by the aid of a large fixed plant for a limited market which would be lost if the price were raised.

As long as the producer is unable to change the nature of the plant, he must pay the tax. An example is found in the iron products from the Rhine districts prepared for the trade as "Sheffield" cutlery. England could in this case tax the foreigner until such time as he could change the character of his product. (c) In the case of commodities that are used only as the substitutes for something else because cheaper, and which would, if the price rose

The foreigner pays a part or all of the tax. higher than that of the commodity for which they are used, not be consumed at all. In this case the foreigner pays a

part or the whole of the tax when the alternative commodity is cheap. For example, rye in Germany when wheat is cheap, especially if at the same time the crop of rye is short. (d)

The foreigner pays a part of the tax. In the case of commodities a large part of whose total consumption is produced in the country, but not enough to absolutely fix the price, which is still above the cost of production. The foreigner in that case may pay part of the tax, since his arrival

The speculator pays the tax. depresses the price. (e) The speculator regularly pays the tax in those frequently recurring instances when the commodity is massed in warehouses on the border ready for importa-

tion on a rise in the price, and on being imported, at the order of various speculators, in large masses depresses prices again. It is a pretty well-established fact, from the investigations of Cohn and Kandtorowicz, that the speculators on the Exchange as a whole lose more than they gain. This loss is in part the consumer's gain through the relief from taxation.¹

SEC. 7. Customs duties regarded merely as a source of revenue depend upon the same principles exactly as those which underlie excises used for that purpose. The greater revenue is obtained with the least expense from a few simple duties upon important commodities.

Technically, customs duties are of two kinds, according as they are levied upon goods in bulk irrespective of their value, or the contrary. *Specific and ad valorem duties.* This technical distinction is of great importance in determining the incidence of these taxes. Duties levied according to the value of the imported commodities are known as *ad valorem*; those according to weight, bulk, or other unit of measurement, are known as *specific*. The latter fall most heavily upon the coarser or cheaper grades of commodities. Such a tariff is, therefore, regressive and contrary to the spirit of many consumption tax

¹ See the masterly treatment of the whole of this intricate subject by Lexis, "Handel," in *Schönberg's Handbuch*, 2d ed., Vol. II., XXI., sec. 77; also Conrad, in his *Jahrbuch*, XXXVII.; Cohn, "Zeitgeschäfte und Differenzgeschäfte," in *Hildebrand's Jahrbuch*, VII., p. 388; brought down to date in 1890 by Kandtorowicz.

systems, which usually tax luxuries more heavily than other commodities. But the great saving in expense, and the great ease of collecting and administering specific duties, go a long way in recommending them. *Ad valorem* duties demand more machinery of administration, as, for example, the certification of the consul in the place where the goods come from to the correctness of the invoice, a corps of appraisers, and a careful examination or inspection of all incoming goods. Little of this is necessary in the case of specific duties. Specific duties are now retained mainly for simple commodities of uniform value per unit, or for rough groups of articles, whose value is easily ascertained.

The watching of the frontier and the prevention of smuggling is one of the primary difficulties that have to be overcome in the administration of customs duties. Goods of high value and easily portable are not very well adapted to pay such duties, unless they can be obtained only from distant countries and are thus easy of identification. Whenever there is a heavy excise on any commodity there is generally a correspondingly heavy customs duty as well. Sometimes the imported commodity pays both the duty and the excise or a part of the excise.

The political or protective element in customs duties has been gradually retreating in importance, and the fiscal has correspondingly advanced. Stein ¹

¹ Vol. II., Part II., p. 377.

makes this the sole law in the history of customs duties. It would be best characterised as an advance of the fiscal interest, leaving the political or protective interests the same as before. The pressing wants of nations, and the fact that federal governments have been well-nigh confined to these taxes, has necessitated this advance.

SEC. 8. We may now look at some examples of customs duties. Those of England are particularly instructive.¹ The term "*consuetudines*," or customs, applied to the duties levied upon imported and exported commodities even before the Magna Charta, bespeaks their antiquity. In the time of the Norman kings, however, trade was insignificant and the duties not very productive. The original duty on wine was one cask from every cargo of between ten and twenty casks, two from twenty or more. What the original duty on wool was is not known. Finally the system settled down to a 5 per cent tax on all imports and exports. Down to 1700, these duties were entirely for revenue purposes and had no intentional protective features. At one time their yield was nearly £1,500,000. The eighteenth century saw a changed policy. Special protective and prohibitive duties were established. This was the policy of the entire century, except during the

¹ See Hall, *History of the Customs Revenue*, and Dowell, *History of Taxation*.

"long peace" of Walpole, 1722-1739. By 1759, the general charges were 25 per cent, while many commodities, like tea, coffee, sugar, wines, and spirits, paid even more. The expenses of the wars which marked the turn of the century led to a general increase of charges on revenue-yielding commodities. Yet with all the many increases in the tax charges there was not a corresponding increase in revenues. In some cases, the high duties of the war period exceeded the limit of what the goods would bear. For example, sugar paid duties ranging from 20s. to 39s. per hundred-weight during the first fifteen years of the nineteenth century. But the annual income was least when the duties were highest. Consumption fell off half a million hundredweight under the higher price. It must be noted that this result was obtained in the case of a commodity not produced in the country itself. Salt, also, bore a heavy duty in this period to the lessening of the consumption. Tea, coffee, tobacco, wine, and other foreign products were also subject to revenue duties so high as to be close to, if not beyond, the limit of greatest productivity.

Interesting and instructive is the experience of England with protective duties. Export duties on raw material, or the prohibition of the exportation thereof, as in the case of wool, was originally one of the most prominent features of the English system. From the middle of the seventeenth century down to 1825 the

*England's
protective
duties.*

exportation of home-grown wool was forbidden. Until 1802, however, the importation of wool was free. Then the import duty rose rapidly from 5s. 3*d.* per hundredweight, in 1802, to 56s. per hundredweight, in 1819. To encourage the production of raw silk, heavy duties were placed upon that commodity in 1765, and not lessened until 1825. Linen manufacture was encouraged by bounties.

The chief battles over the customs duties in England were waged around the "corn-law."¹ Two things among others of minor importance seem to have contributed mainly to the establishment of protective duties on bread-stuffs.² The first was the existence of heavy public burdens upon land, and the desire to compensate land owners and land users therefor. The other was the desire to make England as independent as possible of all foreign nations for her food supply, and to keep even the poorer lands in cultivation. According to the advocates of this policy, protection was needed to enable the proprietors and tenants to buy manufactured products. It was the political power of the proprietors that enabled the policy to be maintained. The various tariffs that prevailed may be conveniently summarised as intended generally to maintain a chosen price, which it was assumed would enable

¹ The American student must bear in mind that in England "corn" means wheat, or, in general, bread-stuffs.

² See McCulloch, *Taxation*, p. 206; Wilson, *National Budget*, pp. 62 ff.; Levy, *History of British Commerce*, 2d ed., Part II., Chap. 7; Rand, pp. 207 ff.

the producer to live, and would not place too heavy a burden on the consumer. Hence the frequent recourse to a sliding scale by which a higher duty was imposed as the price fell. The best example is the scale adopted by Sir Robert Peel (5 and 6 Vict. c. 14), by which the duty was to be 20s. per quarter when the price was 50s. and 51s., and decreased 1s. per quarter for every rise of 1s. in price; so that the duty should only be 1s. per quarter when the price rose to 70s. and over. The idea was, clearly, to maintain, if possible, a price of at least 70s. A similar purpose underlay the earlier prohibition of importation, until the price rose above 80s. per quarter.

Popular agitation, headed by the Anti-Corn Law League, was based upon the hope of cheaper food supplies. It was supported by the rapidly growing manufacturing interests in the expectation that cheaper food would result in a fall in wages. After years of effort, it brought about the repeal of the corn laws in 1846. The sympathy aroused by the Irish famine of the same year contributed to this end. Just before the repeal of the corn laws Peel had, in 1842, simplified the whole tariff by eliminating many of the protective features, especially by removing duties on raw material and freeing a number of small articles. As a substitute source of revenue the income tax was restored. Gladstone, in 1860, completed the removal of protective feat-

The elimination of the protective features.

ures. Since that time it has been true, in the words of Bastable, that "the English customs system is remarkable for its vigorous adherence to the principle of purely financial duties. All traces of a political aim in the imposition of customs duties have now disappeared." Customs yielded £20,164,114 in 1894 from the following articles: —

Spirits: rum, £1,938,181; brandy, £1,364,058; gin, £154,088; others, £674,257; beer, etc., £14,582; tea, £3,493,094; tobacco, etc., £10,119,954; wine, £1,210,141; chicory, £57,130; cocoa, £102,665; coffee, £164,985; currants, £120,977; figs, plums, and prunes, £55,135; raisins, £189,160; all others, £4,886.

There are now only 40 rates in the English customs tariff. In 1875 there were 53, as against 397 in 1859, and 1046 in 1840.

SEC. 9. The difficulty of administering customs duties in the small and scattered areas of the different States of Germany led to the formation of the German customs union *The German customs union.* (*Zollverein*) in 1833. This union, which at first embraced a population of 25,000,000 and a territory of 80,600 square miles, grew in size and in permanence with the renewal, from time to time, of the treaties which bound together the States composing it, and with the entrance of new States, so that in 1854 it embraced 98,000 square miles and 35,000,000 inhabitants. It was the core of the present German Empire. At the beginning

the moderate, mainly revenue, duties of Prussia were adopted. In the tariff of 1865 the rates were lowered and many removed. Duties on grain and on almost all raw materials were removed, and the duties on manufactured goods reduced. The free-trade tendency which accomplished this change lasted until long after the formation of the Empire, indeed, down to 1877.

The constitution of the Empire confers upon the Imperial legislature the exclusive power to regulate customs. It may levy taxes to any amount upon *The customs of the Empire.* all articles exported or imported, for revenue purposes or for protection or for both. But the Imperial legislature cannot tax anything else. Further revenues, if needed, can be raised in the form of an apportioned requisition upon the commonwealths of the Empire. The growing need of the Empire for revenues was accompanied by a wave of protectionist sentiment, so that the increased duties were more and more protective in character. It is true, however, that the revenue features were increased at the same time.

Particularly interesting is the duty on grain, introduced in 1879, and raised several times since then. The rate is now 5 M. per 100 kilograms for wheat and rye, 4 M. for oats, $2\frac{1}{4}$ M. for barley. These duties are in some measure protective in ordinary seasons. It is frequently found that a part of the revenue which flows into the treasury from this source, especially in extraordinary years, is paid by

others than the consumer.¹ Generally, however, the consumers pay the home producers a goodly sum in the shape of higher prices. The operation of these grain duties has been materially modified in recent years by the conclusion of commercial treaties with some of the grain-producing countries. The main revenues from customs duties in the Empire come from coffee, tobacco, wine, and grain.

SEC. 10. France has a highly developed system of customs duties. By the edict of 1664 Colbert attempted to reduce to a single uniform *History of the* scheme all the confused and multifarious *French tariff.* customs charges that had come down from feudal times and were in the hands of many different authorities. The tariff thus established was protective in character and was dictated mainly by the mercantile doctrine. But many provincial duties were left, and as time went on confusion increased. The Revolution swept all the old taxes away, and in 1791 the system which is the basis of the present one was established.

The development since then has been gradual. Prohibitions of imports and exports, so numerous in the tariffs of the ancient monarchy, have now all been removed. Since 1863 the only exceptions to this statement are books that infringe the copyright law and munitions of war. To ensure the proper registration, for statistical research, of all traffic, there used to be an import charge on all goods of

¹ See examples cited above, also Cohn, pp. 565 ff.

15 centimes per 100 francs' worth or 50 centimes per 100 kilograms, and an export charge of 25 centimes per 100 kilograms. These have been removed.¹

During the period subsequent to the Revolution, and down to 1814, war measures left no opportunity to test the tariff of 1791. The Restoration established a highly protective system at the instigation of the Chambers. The Second Republic continued the same policy. Napoleon III., finding himself unable to persuade the deputies to change the tariff, removed many of the prohibitive duties by treaties. The first of these treaties, with England in 1860, fixed the maximum *ad valorem* duty on English goods at 30 per cent for the first four years and 25 per cent after that. Other treaties followed extending similar privileges to other countries. In the spirit of these treaties the tariff itself underwent many amendments, raw products were admitted free, duties on foods were removed or lowered, and the duties protecting the stronger manufactures were lowered. By 1873, that is, after the struggle with Germany was over, and after the revenue system had been rearranged to meet the tremendous burden which

The two tariffs. was the consequence of the war, France had two distinct tariffs. First, the general tariff built upon the law of 1791 amended many times. Second, a conventional tariff based

¹ On the whole subject see Levasseur, "Recent Commercial Policy of France," *Journal of Political Economy*, Vol. I., No. 1, December, 1892.

upon treaties. Since these treaties generally contained the clause granting each nation the same privileges as the most favoured, this tariff was more uniform than the method of construction would lead one to expect. In 1881 the general tariff was pretty thoroughly revised so as to approach the treaty tariff. Manufactures were slightly protected. With this as a starting-point new treaties were made.

One of the most remarkable reforms that any tariff has ever undergone was accomplished in 1892. This was the passage of two tariffs in a *The tariff re-* single law. There was first a general *form of 1892.* tariff or maximum which was to be levied on goods from all countries not obtaining special privileges by treaties. Second, a minimum tariff marking the lower limit to which the concessions might go. The latter was to be applied to the native products of those countries which grant French products reciprocal privileges. Both of these tariffs were protective. There are over 700 items in the maximum tariff, but the number on which concessions could be made was considerably less.

SEC. 11. The tariff history of the United States has been written many times.¹ Its effects have been explained in many different ways. Not *Tariff history* one of the many histories is clearer and *of the United* more impartial than the short statement *States.* by Professors Seligman and R. Mayo Smith, printed

¹ Sumner, *History of Protection in the United States*; Taussig, *Tariff History of the United States*, 1789-1888.

(in English) in the publications of the *Verein für Socialpolitik*, 1892 (Vol. XLIX., Part 1). Nothing but the barest outlines can be attempted here.

The colonial policy of England prohibited the exportation of the more important commodities, the "enumerated" articles, to any country but England. Importation was to take place only from British ships. As was seen in the chapter on protective expenditure, bounties were paid to encourage agricultural products. The only import duty in the colonies was that imposed in 1773 on rum, molasses, and sugar from other than British colonies.

After the war of Independence there was a movement to protect the new industries which had sprung up. As Congress did not, until the adoption of the new constitution in 1789, have the power to collect duties, the commonwealths tried to afford the desired protection. There is naught but confusion in these efforts, all of which, however, came to an end when the commonwealths were forbidden to levy customs duties.

The tariff was the sole source of tax revenue which the new federal government had. It was, consequently, largely utilised from the first. *The beginning of the tariff.* Down to the close of the war of 1812 the tariffs were, in effect, if not in intention, revenue and not protective tariffs. The rates were generally low, except on purely revenue articles like sugar, tea, coffee, and wine. The Orders in Council, the Berlin and Milan decrees, on the east side of the

Atlantic, and the Embargo and Non-Intercourse acts, on the west side, followed by the war of 1812, gave absolute protection to American industries and seriously lessened the growth of the customs revenue of the government for a period of seven years. It is not surprising, therefore, to find the new industries which had been forced into existence during that time calling loudly for protection after the peace. A strong protectionist sentiment arose which initiated a policy that had scarcely more than a temporary setback from 1816 to 1895.

That policy was to combine high protective duties with important revenue

The beginning of the protective policy.

duties. The main arguments advanced for and against the policy of protection have been stated under Expenditure. The industries protected were the textiles, cotton and wool, and iron. Among the revenue duties may be named those on tea, coffee, and wine, and perhaps those on sugar and tobacco. The first period of the protective policy passed the highwater mark in 1828.

The only important setback which the policy sustained before the recent tariff, was in the so-called free-trade period from 1846 to 1860. The act of 1846 was heralded as a tariff for revenue only, but it was still highly protective.

The duties on the classified commodities ranged from 5 per cent to 100 per cent ;

The so-called free-trade period.

the last on spirits. Some purely revenue duties were removed entirely, as, for example, the duty on

tea and coffee. The protected textile industries retained their duties for the most part; woollens 20 to 30 per cent, cottons the same, iron 30 per cent. All the duties were made *ad valorem*, a change which involved an increase in the cost of administration. A more substantial reduction was made in 1857.

The crisis of 1857 resulted in a serious decline in the revenues, and just before the civil war broke out, Congress passed the so-called Morrill tariff, March 2, 1861. This tariff increased the protective duties, especially on iron and woollens. From the technical side this act made two changes of note. First, specific duties were again restored, second, the system of so-called compensating duties was initiated. This second feature, which afterwards received a very broad application, can best be made clear by an illustration. The Morrill tariff increased the duty on raw wool. To compensate the manufacturers for this, a specific duty, supposed to represent the duty on raw materials, was placed on manufactures of wool, together with an *ad valorem* duty for protection.

Immediately after the passage of the Morrill act the war broke out. Under the pressure of the need for revenues Congress passed a long series of acts increasing the duties on purely revenue articles, putting duties upon articles hitherto free, and raising as compensation the protective duties. The idea of giving compensatory duties was extended to cover the burden of internal

taxes also. Thus the manufacturers were, in 1864, given special compensatory duties to offset the heavy internal taxes. This remarkable protectionist measure, embodied in the act of 1864, was rushed through Congress with only one day's discussion in each house. It represents the highest limit ever reached. Nearly 1500 articles were enumerated; the average rate was close to 50 per cent. It shows the effect of three different forces: there was (1) the desire to increase the revenues; (2) the feeling that the manufacturer had a good claim for compensation for the high taxes in general; (3) the mad scramble to gain all that could be gained from this class of legislation.

This act afterward received a number of amendments to meet the changes made in the other parts of the revenue system, but the character of the tariff was not materially changed until 1883. One of the most interesting changes, technically, was the fixing, in 1866, of the method of ascertaining the value upon which the duty was laid. It was provided that the value should be determined by adding to the value, at the place of shipment, the cost of transportation, packing, commission, warehousing, and other charges which fell upon the goods before their arrival.

The protection policy thus extended gave strength to vested interests which thereafter supported that policy. The only changes *Modifications.* of note down to 1894 are the attempted reforms

of 1870, 1873, and 1883, and the McKinley tariff of 1890, which reduced the income by removing the duties on purely revenue articles and on very strong, self-sustaining industries, but increased the protective features.

In 1894 came a change that is very important. The McKinley bill of 1890 had become practically the platform of the Republican party, and the Democratic party went into power pledged to the reduction of protection. They proceeded slowly to the fulfilment of these pledges. The famous Wilson bill was reported Dec. 19, 1893, and became a law Aug. 27, 1894, without the approval of the Democratic President. It failed of his approval because of the objectionable features introduced in the Senate. Two things prevented the change from being sweeping. The first was the power of the vested interests in the protected industries. Every sort of pressure, short of illegal, was brought to bear in favour of the existing system. The second was the patent danger of too sudden a decrease. Sweeping reform would ruin industries and create a depression.

The changes may be roughly summarised as follows. Forty-five articles previously taxed were put on the free list. Among these the most important was wool. The duties on woollens were "compensatingly" reduced to an average of about 40 per cent as against the old average of nearly 100 per cent. Copper was

*Reduction of
protective
duties.*

*Analysis of
the recent
reforms.*

made free, as was also lumber. Iron ore was, after a struggle, left dutiable. The chief feature of the McKinley bill had been the removal of the duty on sugar. This was restored to the tariff with a duty for the sake of the revenue. On all the rest of the list the duties were reduced by from 20 per cent to 40 per cent. It is well-nigh impossible to summarise the result further; the items are too numerous and there is a lack of guiding principles. The reductions carry the tariff lower than it has been at any time since the war. The level of 1857 has been reached but in a very few instances, though in some cases a lower limit has been reached. The immediate result was a material falling off in the revenues. This is, however, due to the coincidence of the reduction with a serious industrial depression and will probably not be permanent.

CHAPTER VIII

PROPERTY TAXES

PART 1. *The General Property Tax.*

SECTION 1. In the general property tax the basis is the entire amount of property, real and personal, owned by the tax-payer. It is usually paid out of the income of the tax-payer derived from any source, but inasmuch as it forms a lien on the property it may be paid from that. The tax rests, theoretically, upon one of two ideas : (1) that property measures faculty ; (2) that property measures benefit. In the older forms of this tax, when there was little opportunity to buy or sell land, or to invest capital, it was pretty generally true that property did measure faculty. In modern times the theory that benefit can be measured by property has led to the retention of the tax. The fallacy of that theory has been shown.

The general property tax is, as we have seen, very old. It is still the main reliance of Switzerland and the United States for supplying the revenues of the component parts of the federal systems. Prussia and Holland have recently reverted to it. This reversion to a form of taxation which has been the subject of

almost universal condemnation suggests the necessity of re-examining the grounds upon which those objections were based. Among many there are two of great importance. (1) It is urged that the tax is unjust because property forms no criterion of tax-paying ability. It is maintained that *Objections to income is a far better basis.* (2) It is *this tax.* urged that the general property tax is inexpedient because so difficult to administer justly, especially in the matter of the discovery and assessment of personal property and because of its effect on the movement of capital and forms of investment. Against these serious objections it is urged that when there is a tolerably just system of income taxation already in existence a property tax in addition thereto fulfils the requirements of justice because it imposes a heavier burden on "funded" income, which is regarded as indicative of more faculty since it is less precarious. It also supplements the income tax by making property in enjoyment, the use of which is an indication of tax faculty, a part of the base, as for example picture galleries. And, lastly, the comparative steadiness of the return from the property tax is a great recommendation from the fiscal standpoint. It would seem, then, that the objections to the general property tax as the main part of a system still stand, but that there may be room for such a *When this tax tax as a subordinate part of a larger sys-* *is justifiable.* tem, the demands of justice being met by the proper relation between the different parts of the system.

In Switzerland and Prussia the general property tax is part of a more elaborate system. In the United States it stands almost alone for commonwealth purposes, supplemented in a few isolated instances by other taxes intended to reach certain forms of revenue-yielding property. The universal condemnation of the American commonwealth general property tax is therefore not due to the defects in the tax itself, but mainly to the fact that it is not properly supplemented by other taxes.

The first question that arises when the general property tax stands alone, and a question which although not so prominent also arises in other cases is: Can the method of assessment be made sufficiently effective to reach all forms of property, especially personal property? The answer to this question that has been given by the experience of all nations, is emphatically in the negative. This is especially true when the administration of the assessment is left to officials popularly elected for a short term. It is also in the negative, but somewhat less unanimously so, when the assessment is under the control of an impartial bureaucracy appointed by a monarch or holding office practically for life. In the United States it is notorious that almost all personal property escapes.

The report of the extensive investigations of the Eleventh Census (1890) into the matter of local and commonwealth taxation has just been published.

The census office undertook to ascertain the true value of property, *i.e.* its fair selling value. This serves as a basis of comparison for the assessed values. The investigations of the census were conducted with the utmost care, and although they inevitably contain many unavoidable sources of error they are yet very serviceable. The following table shows the results of the investigations into the true value of property:

Real estate, with improvements thereon . . .	\$39,544,544,333
Live-stock on farms, farm implements, and machinery	2,703,015,040
Gold and silver coin and bullion	1,158,774,948
Mines and quarries, including product on hand	1,291,291,579
Machinery of mills, and product on hand . . .	3,058,593,441
Railroads and equipments, including street railroads	8,685,407,323
Telegraphs, telephones, shipping, canals, and equipment	701,755,712
Miscellaneous	7,893,708,821
Total	<u>\$65,037,091,197</u>

The total assessed valuation was \$25,473,173,418 or about 40 per cent (41 per cent if we allow for \$3,833,335,225 exempt by law). Of real estate, — land and its improvements, — the true value was \$39,544,544,333, of which all but \$3,833,335,225 is legally subject to taxation; the assessed value of the \$35,711,209,108 taxed was \$18,956,556,675, a little over 50 per cent of its true value. The \$25,492,546,864 of personal prop-

erty was assessed at \$6,516,616,743, about 25 per cent. But if we make allowance for the \$1,291,-291,579 worth of mines and quarries which might be well classed as real estate, personal property is assessed at about $22\frac{5}{10}$ per cent of its true value. As the statement of the total amount of personal property errs admittedly on the side of moderation, there being some forms which were not ascertainable, this showing is more favourable to the assessment than the truth would be. It is well within the truth to say that in the United States as a whole not more than 20 per cent of personal property is taxed. Probably considerably less than this is the true figure. In many important commonwealths the assessment of personal property even according to the favourable showing of the census is far below the average for the whole country. In the country as a whole, personal property is about 71 per cent of real estate or $41\frac{5}{10}$ per cent of all taxed property. In New York it is assessed at a trifle over 11 per cent of the real estate and about 10 per cent of all property. According to the census valuation there was in New York \$5,817,-704,667 worth of real estate and \$2,758,997,324 worth of personal property. Real estate was assessed at \$3,403,751,246, or about 58 per cent of its real value, while personal property was assessed at \$382,159,067, or not quite 14 per cent of its real value. When it is remembered that the census report omits some unascertainable items

of personal property it is fair to say that 90 per cent of the personal property in New York is untaxed, where at the same time only 42 per cent of real estate is untaxed. This means that the assessment of personal property is evaded and that real estate is assessed below its actual value. The latter fault is not so bad as the former because general under-assessment means merely a higher rate than would otherwise prevail, but does not affect the distribution of the burden. Pennsylvania, Massachusetts, and Ohio show somewhat better assessment of personal property. Thus in Pennsylvania the assessed value of personal property is 618 millions against 2042 millions of real estate; Massachusetts, 554 millions against 1600 millions; Ohio, 546 millions against 1232 millions. But no one supposes that there is any more personal property owned in these commonwealths than in New York. In fact the contrary is the case. In some of the newer western States the assessment of personal property is larger than the assessment of real estate. Thus in Montana personal property is 58 millions, real estate 55 millions; in Wyoming the ratio is 20 : 13; New Mexico, 28 : 15; Arizona, 18 : 10; Nevada, 17 : 9; Idaho, 16 : 10. But this is easily explained. (1) In these States, land values have not yet developed. (2) The real property assessed is only such lands, with their improvements, as have fully passed into the hands of private owners. (3) Personal property is swelled by including in it the improvements upon

public lands the fee to which is still vested in the United States, and upon railroad lands the title to which is still vested in the railroad companies. (4) The list of personal property is swelled by the nature of some of the industries that prevail, — cattle. A certain amount of it is due to the assessment of railroad property as personal property. (5) The possibility of concealing property is less in a country where population is sparse and the conditions for investment well known to the assessors. (6) The need of revenues is very great and real estate has not enough value to bear the burden. Personal property must, therefore, be called in to raise the necessary amount without inordinately high rates. The chart on the opposite page taken from the Eleventh Census shows the relative assessment of personal and real property in all the States.

The failure to assess personal property is due entirely to the laxity of administration; the tax laws

The failure to reach personal property not due to faults in the laws. on the subject are universally strict enough to answer every requirement. What constitutes personal property is explicitly stated; the assessors have

ample power to ascertain its exact amount. In a large majority of commonwealths (all but fourteen) the tax-payer is required to make a declaration of his property. In all the States the assessors have the advantage of large powers of investigation, and can ascertain the amount of the property if they will assert their power. But this is

what locally elected assessors are very reluctant to do.

The questions as to the expediency and justice of a progressive rate, as to the exemption of small properties, and the like, have already been treated.

The assessment of legal persons under the general property tax. The advisability of extending the assessment to legal persons so as to cover a certain amount of property that might escape in the guise of personal property, depends upon the strictness in the assessment. The stocks and bonds of railroad companies are easily concealable personal property of the individual stockholder. But the road and buildings are easily ascertainable real property of the companies. For ease of assessment, therefore, it is best to tax legal persons as well as real persons. But in that case stocks and bonds in the hands of private persons should be exempt, unless it is intended to tax such property more heavily than other property; *i.e.* to introduce a partial progression. Whether in addition to including legal persons in the general property tax a special corporation tax should be imposed is a question of policy affecting the whole tax system.

When the general property tax stands alone, all tax faculty that exists in the form of receipts of the economic character of wages, — salaries, fees for professional services in independent professions, profits and earnings of management, — are untaxed. In the earlier forms of the property tax in the

United States this omission was seen, and a special tax levied upon such income. But at present that method of taxation has almost entirely disappeared.

The technical arrangements for the assessment of this tax vary very much. In some cases the method of rather permanent *cadastres* is feasible for a large part of the property. It is *Assessment.* necessary to make an annual investigation into the amount of personal property held by the different tax-payers, inasmuch as this changes very rapidly. But there is less necessity for such revision in the case of the real estate. A very simple *cadastral* system with revision every five, ten, or fifteen years, is in use in a good many commonwealths of the United States for commonwealth taxation, but annual assessments are in vogue for almost all local purposes. Thus, in Rhode Island, the Assembly fixes the assessment or apportionment of the commonwealth taxes whenever there seems need of revision; in Michigan it is done once in five years; in Vermont once in four years; in Ohio once in ten years. No matter what changes may, meanwhile, occur in the value of property in the towns, the share of each remains the same for commonwealth purposes. Most of the commonwealths, however, require the regular addition of improvements and alterations.

SEC. 2. The property tax as the sole *Scientific* or chief form of direct taxation has no *judgment of the general* supporter among scientific writers. So *property tax.* universal and unanimous has been the condemna-

tion heaped upon this tax that we must consider in detail some of the objections that have been raised.

Professor Seligman sums up his interesting discussion of this tax in words to the following general import :

The general property tax is a failure as the main source of revenue from the triple standpoint of history, theory, and practice.

1. Historically, it was once well-nigh universal. In a community mainly agricultural it was not altogether unsuited to the conditions. But as soon as industry and commerce became important, it failed to extend so as to comply with the requirements of justice. It became in fact, even where not so considered, a tax on real property. Everywhere but in America it has been (*a*) divided into a number of subordinate property taxes, (*b*) allowed to become a subordinate member of another system, or (*c*) entirely abandoned. Sooner or later it will have to be abandoned in America.

2. Theoretically the general property tax is deficient in two respects. First, it assumes that there is an ascertainable general property. But since property is a composite of inseparable but widely differentiated elements this assumption is contrary to the fact. "The general mass of property has disappeared and with it vanishes the foundation of the general property tax." Secondly, "property is no longer a criterion of faculty or of tax-paying abil-

ity." Two equal masses of property may be unequally productive [because used by men of differing talents, and thus differently joined with the personal element, or because the possession of them may give rise to fortuitous gains, or because the owner of one mass of property may be labouring under peculiar economic disadvantages].

It is the income which property yields that is the best index of the tax-paying power which the property represents.

3. Practically, "*the general property tax as actually administered to-day is beyond all peradventure the worst tax known in the civilised world.*" As at present administered it fails entirely to reach intangible property. It debases public morals by putting a premium on dishonesty. It is regressive and presses hardest upon those relatively least able to pay.¹

This is strong language,—even stronger has been used. But no words are too strong to express the iniquities of this tax.

PART II. *Special property taxes.*

SEC. 3. The *land tax* is one of the oldest contributions. It has three forms: (1) it may be based upon each unit of area, sometimes with *Forms of the* an attempt to classify the different units *land tax.* in fertility; (2) it may be based upon the estimated value of the land or upon an estimated average

¹ Seligman, *Essays*, pp. 23-61.

annual yield or surplus; (3) it may be based upon the actual yearly yield, and be as it were a share in the product. The tax was common in the latter part of the middle ages as a recognition of the monarch's right of proprietorship in the soil. A good example of this, among many others, is afforded by the so-called quit-rents in the American colonies.¹ In their first form these payments are not strictly taxes. They are acknowledgments of the people's tenure. But they frequently grow into taxes. In France, as we have seen, the *taille* developed from feudal dues. The *impôt foncier* now yields 255,000,000 francs. In England the old land tax has been converted into a redeemable rent charge, but the revenue from land is still taxed in the general income tax and yields £1,500,000 annually. Local taxation falls largely on land. In Prussia the land tax was in 1895 transferred entirely to the local bodies.

Economic rent as the surplus of revenues from land, after all expenses have been deducted, has always been regarded as a legitimate object of taxation. It has been strongly argued that this tax cannot be shifted. But as the land tax is not always confined to rent-bearing land, being generally imposed upon all land, even the poorest in cultivation, and as modern economic theory does not regard rent as an inevitable surplus, this old argument needs thorough revision. (See Chapter X.)

¹ See Ripley, and Wood.

It is in the assessment of this tax that the *cadastre* has been most widely used. The principles upon which the best *cadastres* have been built are the following: (1) A careful ^{Assessment.} measurement of the land is made and recorded. In the older ones the land is entered in rough historical units: the "yoke," the "hide," the "seed." Sometimes the *cadastre* is intended to serve other purposes, as that of a record of titles. In any case the names of the owners or occupiers are entered with each piece. (2) A record is made of the yield of each unit of area and from that is estimated either the gross revenue or the net revenue,—more frequently the latter. As a rule the *cadastral* revenue is less than the actual net revenue. Another method is that of recording the market value.

The *cadastre* when finished is subject to more or less frequent revision. A partial revision which involves the recording of changes of title, etc., is generally made currently. An entire revision is only undertaken after periods of considerable length. The making of a complete *cadastre* is a matter of considerable expense and takes no little time. In many cases more than the mere land is recorded, buildings and other improvements being frequently entered in the same *cadastre*.

It is generally urged in justification ^{Justification} of the retention of the land tax even in ^{of its retention} countries where there are other taxes ^{by the side of} that fall upon the revenue from land, that the in- ^{other taxes.}

come accruing from land is constantly increasing in every growing community, and that the expenditure of the government accrues largely to the benefit of the land-holders, and appears in the form of an increased value or rental. The same reasons are urged in support of a higher rate for the land tax.

On the basis of a *cadastre* the land tax is generally apportioned; less frequently it is proportioned. In general the tax lends itself better than most others to the apportionment method. With a fixed valuation as a basis which varies comparatively little from year to year, it seems perfectly natural and easiest to apportion the amount that it is desired to raise, among the different pieces or units.

SEC 4. The older forms of the land tax often included the *building tax*, with which it was closely connected in character. At present, *The building tax originally part of the land tax.* this contribution generally forms an independent tax on the revenue from the site and the building. It is, like the land tax, a tax on a fixed source of income. Its incidence will receive special attention elsewhere.

The buildings taxed may be classified according to value, or according to the uses to which they are put, or according to their location, whether *Forms of the building tax.* urban or rural. There are two very different forms of the building tax: one is intended to fall on the income derived by the owner from the building; the other simply taxes the occupier ac-

cording to the rent, taken as the index of a certain amount of tax faculty on his part. The second is very much like a consumption tax. The first regards the revenue derived as a source from which the tax may be paid. But even this first form, when paid by an owner who is also an occupier, is very much like a consumption tax.

The building tax, wherever in use, is one of a number of other similar taxes; it never stands alone. In ease of assessment it has many advantages. The valuation is simple *Assessment.* and inexpensive. Alterations affecting the base can be easily and accurately ascertained. Unlike the land tax the building tax is regularly assessed each year. Hence this tax is more often proportioned than apportioned. The building tax may be extended into a sort of industry tax, as when it is assessed with higher rates upon buildings used for industrial or commercial purposes. An example of this method of assessing the business tax is that of France cited above.

SEC. 5. The taxes we have already considered cover most fixed capital. Circulating capital also, in all of its many forms, has been sub- *Taxation of capital.* jected to separate taxes. This is as true of those countries which have the general property tax as of those which attempt to accomplish the desired results by the taxation of the various elements of revenue. How to reach this kind of revenue and to make the faculty which it represents

bear its share of the public burden, is one of the most difficult practical problems of taxation. The chief difficulties arise from the elusive nature of circulating capital and the intimate way in which it is connected with many of the processes of industrial life. Justice and equality demand its taxation. But various pleas of expediency are against it. Capital is hard to reach, and if it is not fairly taxed the result may be injurious to trade. There are two forms in which this tax has been applied with some effectiveness. One is that of a tax on mortgages, the other that of a tax or taxes on corporations and banks. Some results have also been attained by the attempt to tax stocks and *Taxation of public bonds.* bonds. Public stocks are especially easy of assessment. But there is an objection to taxing them when the other forms of investment escape, because of the bad effect on public credit. If it is distinctly declared beforehand that the bonds are to be taxed, their selling price is lowered. If it is not so declared, at the time of issue, and the tax is subsequently assessed, the process is regarded by the holders as equivalent to a partial repudiation of the debt, and subsequent loans are looked upon askance. When, however, all forms of revenue-yielding capital are, nominally at least, subject to taxation, this objection to taxing public securities disappears. If the tax is not to have the effect of reducing the capital value of the stock, bond, or other secu-

erty, it must fall upon every form of capital. But so great are the difficulties of making it thus universal that, as a general rule, such a tax affects the rate of interest on all new investments in the taxed form. This question will receive further attention under the head of incidence.

Where there is a complete system of public records for deeds, mortgages, and contracts, necessary to their validity, it is comparatively *Taxation of* easy to tax these recorded securities. *mortgages.*

Thus it is that mortgages are generally easily taxable. This, however, results in inequality if the tax is not extended beyond the recorded contracts. When the mortgage is upon property already taxed, as, for example, by the building tax or a general property tax, the question arises whether both the borrower and the lender should be taxed, or only one, and if so which one. An able writer says on this point, "Tax the mortgagee on the amount of the mortgage, and the mortgagor on the value of the property minus the mortgage. That is the only rational system."¹ Indeed, it would be, if every other form of capital were taxed; but when that is not the case, the result is in every respect the same as though the owner were taxed alone. Generally he pays more.

Taxation at the source has been warmly recommended for reaching interest on capital; *i.e.* to have the debtor advance the tax and shift it if he can

¹ *Political Science Quarterly*, V., 35.

to the lender or share it with him. In the case of corporations, this method is applied to the dividends.

Stoppage at the source. As Bastable has well shown,¹ such a tax is a combined tax on interest and on profits, and is therefore partly outside our present

Taxation of corporations. purpose. The taxation of corporations is not always the taxation of circulating capital merely. Corporations often own other taxable property, — land, buildings, etc. But in the United States, one of the main objects of the introduction of taxes on corporations was to reach forms of personal property that generally escaped. The other object was, of course, to extend the general property tax to cover all property. We find that the basis of the corporation tax is, in many instances, the capital stock at its par value, or at its market value; and in a good many instances, the bonded indebtedness is also included. When the nature of the business is such that the capital stock and bonds do not represent all the capital concentrated in the hands of the corporation, as, for example, in the case of banks and insurance companies, then the business transacted, the gross earnings, the dividends, or the net earnings become the basis. But no clear line is drawn between the taxation of interest and profits, so that corporation taxes often approach, in character and operation, business taxes.²

¹ P. 422.

² The best discussion of this interesting field of taxation is contained in Chapters VI., VII., and VIII. of Seligman's *Essays on Taxation*.

SEC. 6. There remains but one other very important property tax and that is the inheritance tax, or the successions tax, sometimes called death duties.¹ The feudal "relief" and "heriot" were payments made from the estate of a dead vassal, or by his heirs, in recognition of the lord's authority. Similar payments were made upon the transfer of property. But the direct connection between these feudal dues and the modern inheritance taxes is hard to trace. It is probable that the older dues suggested the feasibility of the modern inheritance tax. But no closer connection than that has been established. The modern inheritance tax is a special exercise of the taxing power. It is resorted to on account of the comparative ease with which large returns can be obtained at relatively little expense and without great friction. It is generally justified in one of two ways: (1) It is claimed that the deceased person has probably not paid his share of the general taxes during his lifetime, and that the publicity necessarily connected with the transfer of his property to his heirs affords an excellent opportunity for the fiscus to "get even" with him. If this were the sole justification, it would require that the exact history of every estate should be investigated, and only those subjected to

Origin of the inheritance tax.

Justification of the inheritance tax.

¹ See Max West, "The Inheritance Tax," *Columbia College Studies*, IV., 2; also the excellent chapters in *Bastable*, 2d ed., and *Seligman, Essays*, pp. 307 ff.

the tax that could be shown to have escaped taxation. But this would be a laborious and costly process. Another justification is, therefore, sought. (2) It is claimed that in all cases of collateral inheritance, the newly acquired wealth comes to the heir as a fortuitous, more or less unexpected gain. He had been living without it, and this sudden increment of wealth represents, temporarily at least, a sudden increase in his ability to pay taxes. This justification points to the necessity of exempting the inheritance by immediate dependents of the deceased. They were already living upon that property; and the death and breaking up of the family and of the estate represent to them not an increased, but a decreased, tax faculty.

An examination of the many forms of inheritance taxes reveals two main tendencies. The first is to exempt small estates and to establish a progressive rate for larger ones. The second is to exempt that portion of the estate passing to the immediate heirs. The grounds for this second exemption have already been examined. The grounds for the first are wrapped up in the general principles of a proportional or progressive rate. A very good example of these principles is afforded by the new English death duties of 1894, and the older "Legacy and Succession Duties" of 1881, which, however, are not progressive as to amount of property. Under the new law the estate of every person dying after the 1st of August, 1894,

*Tendencies of
modern inher-
itance taxes.*

must pay a duty which varies according to the following schedule :

Estates from	£	£	£ s	
100 to	500	500	pay 1 0	per hundred.
" 500 "	1,000	1,000	" 2 0	"
" 1,000 "	10,000	10,000	" 3 0	"
" 10,000 "	25,000	25,000	" 4 0	"
" 25,000 "	50,000	50,000	" 4 10	"
" 50,000 "	75,000	75,000	" 5 0	"
" 75,000 "	100,000	100,000	" 5 10	"
" 100,000 "	150,000	150,000	" 6 0	"
" 150,000 "	250,000	250,000	" 6 10	"
" 250,000 "	500,000	500,000	" 7 0	"
" 500,000 "	1,000,000	1,000,000	" 7 10	"
" 1,000,000			8 0	"

The older legacy and succession duties are also progressive, but in a different way, rising as the degree of relationship of the recipient of the legacy becomes more and more remote from the deceased, from £1 in a hundred to £10 in a hundred. Thus the total burden that may fall upon the share of any one person can amount to 18 per cent; *i.e.* £10 in £100 of the duties of 1881, and £8 in £100 of those of 1894.

In the United States, inheritance taxes are now in use in thirteen commonwealths. In all but one of these, New York, direct inheritance is untaxed, and there only personal prop-
erty so inherited is taxed. The list of *American inheritance taxes.*
exempted relatives varies somewhat from commonwealth to commonwealth. The taxes are not pro-

gressive. In all but Tennessee a certain portion of the estate is exempt. Probate fees and taxes are very common, existing in most of the States. They are, however, not in proportion to property except in Pennsylvania, Vermont, and Virginia.

CHAPTER IX

PERSONAL TAXES

SECTION 1. The simplest form of personal taxation is the collection of an equal contribution from each citizen. But such a tax cannot be large, else it would impose a burden beyond the ability of the poor. A poll tax by itself cannot yield sufficient revenue to support the government. *The poll tax.* The uniform *per capita* tax is not just unless all wealth is equally distributed, and only in a very primitive community is such equality found. Hence it is that, outside of the United States, the poll tax now arouses nothing more than an historic interest. In the United States there are about thirty commonwealths that still have the poll tax. It is levied on all males between the ages of 20 or 21 years and 45 or 60. It is very laxly and poorly collected in almost all cases, being in general successfully evaded by all who have no other tax to pay. In four cases it takes the form of a fee for the registration of voters. In the early taxes of the commonwealths of the United States there was frequently an assessment of each person at so much per poll as a part of the general property tax. In some commonwealths the poll tax still exists in this form.

In a few cases this contribution is used for local purposes ; thus, in some commonwealths there is a road tax of so much *per capita* assessed upon those individuals who are found by the authorities on the road. The road tax is generally payable either in labour or in money.

The returns from the poll tax are generally insignificant. Despite the apparent ease of assessment the poll tax is expensive to collect. It frequently causes much opposition and friction. It militates against the demands of equality, and has been superseded by other forms of personal taxation, which recognise differences in faculty.

SEC. 2. We have already seen how the poll tax in one instance developed into the income tax. That

*The theory of
the income
tax.*

tax will now be studied more closely. While it is true that, since the abolition of the federal tax, the income tax has little more than a theoretical interest for American readers, yet inasmuch as the hopes of reformers all centre in it, and inasmuch as it may any day, again, become a live question, it is well to give the theory of the tax some consideration here. While the general, or special, property taxes rest either on the benefit theory or on the faculty theory of taxation, income taxes are better defended from the standpoint of the faculty theory. It is easier to make it clear that income measures faculty, than it is to show how income can measure benefit. To be sure, it has been claimed with some plausibility

that income is a sure indication of the benefit enjoyed under the government. But that proposition requires more argument and explanation than does the simple statement that a citizen is able to pay more or less because he has a greater or a smaller income.

Besides this advantage of easier justification, the income tax has in common with all personal taxes another recommendation. It levies directly on the tax-payer. The nation's income from taxation is derivative. As such it is abstracted from the annual increment of wealth of the citizens. Any taxation which is actually paid out of capital or property is ruinous. Property taxes as we have seen are, theoretically, paid from the revenue earned by the property or out of other income of the owner, the property being at best but the indication of faculty or of benefit. But the income tax finds the indication of faculty in the source of the tax. There is a certain directness about this identification of base and source which theoretically, at least, is a strong recommendation of this form of tax.

From the standpoint of the faculty theory no general property tax, and no system of special property taxes which has not, incorporated in it, a tax on wages, salaries, profits, and the like, can be called equal. Many persons enjoying comparatively little property live in luxury and ease from their personal gains, while many others possessing comparatively large property may be from time to time in serious

straits. For example, to be "land poor" is to be poor indeed. Large property does not always imply ability to pay taxes, and the absence of property does not always imply absence of ability.

There has been a feeling in the United States, not always clearly expressed, yet strong enough to influence legislation, that the earnings of personal exertion, professional fees, and the like are not good subjects for taxation. This is the result of an extreme *laissez-faire* view, which decries every sort of interference with individual freedom. Every tax is seen or felt to have a repressive tendency, which is sometimes supposed to be one of the main objects in assessing taxes.¹ It is feared, then, that to tax the earnings of men would discourage exertion, would discourage industry. That this is a mistaken view of the nature of taxation, will, in the light of our whole discussion, be evident from the mere statement. A general tax on all income would not discourage income getting, but might even act as a stimulus thereto, more income being required to meet the tax and the same expenses as before. It may be true that this form of income represents less faculty than income from property, because more precarious than the latter, which furthermore leaves the owner free to engage in the getting of other in-

¹ A liquor license in a certain western town cost \$100. A tax of \$100 was put upon banks. The bankers held up their hands in horror: "The people think the banks are as undesirable as the saloons!"

come. But the entire exemption of personal earnings cannot be justified.

SEC. 3. The form of the income tax will be determined by the place given it in the system of taxation. If it were possible to administer a single tax of any sort in accord with the demands of justice, the income tax *The place of the tax in the system.* would be, theoretically, the one to be chosen. But the objections to any single tax, already stated, bear upon this as well as upon any other. Theoretically, it is best to make the income tax the central one of the system, the gaps of which are filled in by other taxes. If this be the intention, then the income tax can be arranged in the form in which it is most easy to administer. Thus the very small incomes can be exempt from the income tax, being covered by direct and indirect consumption taxes. In this way one source of difficulty and friction is avoided. Then no distinction need be made in the assessment of income from different sources. For if it be decided to tax income from funded investments at a higher rate than other forms of income, this additional tax can be laid on in the form of a property tax. How far the exemption of smaller incomes should go, or to what extent funded incomes should be more heavily burdened, depends upon the concrete facts in each case. An abatement of the burden in cases where there are already more than the usual claims on the income, as of a large family, is, also, sometimes given.

SEC. 4. As an example of such a tax, not, perhaps, ideally perfect, but still laid down in accord with the general principles enunciated above, we will study somewhat in detail the Prussian income tax.¹ In order to have in mind the main features of the development already outlined above, Chapter V., we quote from Mr. Hill the successive stages in the growth of personal taxation in Prussia :

"1. A uniform poll tax, 1811.

"2. A class tax, collecting somewhat more from the prosperous, and not less from the poor, 1820-1821.

"3. To supplement the class tax, an income tax with comparatively few classes, a uniform rate, and a maximum limit, 1851.

"4. Classification made finer, the maximum limit removed, and the class tax below made practically an income tax with a progressive rate, and the exemption of incomes up to 420 M., 1873.

"5. Exemption of incomes up to 900 M., reduction of the remaining rates of the class tax, and of the two lowest rates of the income tax, 1881-1883.

"6. Principle of progression extended to all incomes under 100,000 M., incomes under 10,000 M. taxed less than before, and higher incomes more ; a

¹ For history see Hill, *Quarterly Journal of Economics*, VI., 207 ; Wagner, "Die Reform der directen Staatsbesteuerung in Preussen im Jahre 1891," *Schanz' Finanz Archiv.*, VIII. Jahrgang, II. Band. A full statement of the law is there appended.

declaration of income by the tax-payer required, and a finer classification adopted, 1891."

To make the new tax still more clear we quote the rates from the law itself:

TARIFF OF RATES.

from	Incomes.	to (inclusive)	Rate.
M.		M.	M.
900		1,050	6
1,050		1,200	9
1,200		1,350	12
1,350		1,500	16
1,500		1,650	21
1,650		1,800	26
1,800		2,100	31
2,100		2,400	36
2,400		2,700	44
2,700		3,000	52
3,000		3,300	60
3,300		3,600	70
3,600		3,900	80
3,900		4,200	92
4,200		4,500	104
4,500		5,000	118
5,000		5,500	132
5,500		6,000	146
6,000		6,500	160
6,500		7,000	176
7,000		7,500	192
7,500		8,000	212
8,000		8,500	232
8,500		9,000	252
9,000		9,500	276
9,500		10,500	300

The rate increases

from	to	in stages of	by
M.	M.	M.	M.
10,500	30,500	1,000	30
30,500	32,000	1,500	60
32,000	78,000	2,000	80
78,000	100,000	2,000	100

In the case of incomes from 100,000 M. to 105,000 M. the tax is 4000 M. And from that point on the proportional rate of 4 per cent is assessed upon the lower limits of stages of 5000 M. each.

This rate is progressive from about two thirds of one per cent at 900 M. to 3 per cent at 10,000 M. Then the rate is nearly proportional at 3 per cent up to 30,000 M. Then progressive again, until at 100,000 M. 4 per cent is reached, after which it is proportional again. Each tax-payer having an income of over 3000 M. is required to "declare" it. He has to fill out a blank calling for a statement of income from each of four sources: (1) from capital invested, interest and dividends; (2) from landed property and houses, including all crops, whether consumed in the house or not, but deducting the cost of cultivation; (3) from trade, industry, or mining, deducting the cost of maintenance; (4) from any employment, wages, salaries, fees, and including pensions and every source of income not covered by (1) (2) and (3). Deductions are allowed (1) for interest on debts, except that on business debts; (2) for permanent legal burdens (example, maintenance of reserves), (3) contributions to sick funds; (4) life-insurance premiums. This division of the income into different parts is for the sake of accuracy of declaration, not for the sake of assessing different rates on the different kinds of income.

Persons with large dependent families or labour-

ing under any special economic conditions seriously affecting their faculty are allowed an *abatements* abatement of not more than three grades *allowed*.

provided their incomes are not over 9500 M. Persons having less than 3000 M. deduct 50 M. for each child under fourteen years of age, and if there are three such children a reduction of one grade is made.

Corporations and stock companies pay the income tax on all dividends over $3\frac{1}{2}$ per cent. This makes double taxation of this income, which is regarded as particularly "capable." In other ways the attempt is made to tax funded income more heavily. The exemption of incomes below 900 M. (\$225) and the lower rate for smaller incomes is justified on the ground that the consumption taxes already impose a burden on these persons.

The assessment of the tax is not perfect. It is said to be considerably better, however, than the assessment of property in America. Large incomes escape in part. It has, however, an advantage in that the evasion of the tax does not in Prussia as it does in America intensify existing differences and inequalities. Other parts of the system tend to offset the failure in this case.

SEC. 5. The British income tax, correctly called "the property and income tax," may *The property and income tax in Eng-* serve as another illustration, but it dif- *land* fers very much from the Prussian. Log- ically, this tax might have been treated in the previous chapter, but it is as well to discuss it here.

In the first place, as has already been stated, it is rather a system of taxes on revenue than a tax on the aggregate income of each person. It is a system of modified property taxes, with a wage and salary tax appended. In Prussia the intention is to make the total income the base irrespective of the source, and reference to the sources is called for in the declaration merely as a means of getting at the total with greater accuracy. In England the different sources are kept strictly apart, and there is a difference made in the treatment of each kind of income: the tax being in some cases "stopped at the source." The total income is only called into use in estimating the exemptions and abatements. The tax-payer has the right by summing up his whole income to show that he has been taxed too much, or is entitled to exemption. In that case he is reimbursed. In 1895 such abatements amounted under schedule A (see below) to £800,000; on small incomes the amount returned was £840,000. So separate are the different parts of this tax that Mr. Wilson says of it:¹ "To the bulk of the people, it is known in its most obnoxious (?) form as a tax upon ordinary incomes, salaries, professional earnings, profits of trading, etc." Bastable (p. 449) says: "Inequalities are, however, removed by the comprehensiveness of the tax."

The various revenues are taxed in five "schedules," known as schedules A to E.

¹ P. 115, *National Budget*.

Under schedule A, Great Britain taxes the revenues received from property by owners of rented lands or houses (tenements), proceeds from tithes (not commuted), royalties, etc. Mortgages are taxed in this schedule, owners being allowed to deduct what they advance in taxes from the interest they pay. By a change recently made in the income tax, in consideration of the burden of the inheritance tax, revenue assessed in schedule A may receive an abatement of one-eighth in the case of that from farms, and one-sixth in the case of that from buildings.

Under schedule B is taxed the income gained by occupiers of land (tenements and hereditaments) except where the land is used as the means of carrying on some trade ; as, for example, nursery gardens. Owners in occupation pay under this head.

Under Schedule C is taxed the income from annuities, dividends, etc., not paid from the public funds. The banks are required to deduct the amount of the tax from the interest paid.

Under schedule D are taxed salaries, professional earnings, profits of trading, etc. (railways, canals, mines, gas-works, water-works, etc.), and all gains not included in the other schedules. Most wage-earners evade the tax, or are exempt on account of the smallness of their incomes.

Schedule E includes public salaries and pensions of employees of the State, or of the corporate bodies. This tax is stopped at the source.

Incomes of less than £400 are assessed at £150 less than they really are. Between £400 and £500 at £100 less. These abatements exempt all persons with less than \$750 annual income and lessen the burden for all up to \$2500. It is, therefore, a tax on large incomes.

This tax is the variable element in the English system, the rate being changed from time to time according to the estimated requirements.

Its place in the system. The indirect taxes, the excise and the customs duties, being necessarily of fixed rate, yield a steady return, which grows slowly. And any variation in the probable expenditure can be met by changing the rate of the income tax. The annual yield is now about £15,000,000, or about one-sixth of the total revenue of the government. A rather large change in the rate of this tax, would, therefore, not result in a very great change in the total income.

The assessment of wages, business profits, and the like, is said to be very lax. But this is tolerable because the indirect taxes, which, together, are more than one-half the public income, may be said to fall on that. Life-insurance premiums may be deducted from the taxable income.

SEC. 6. The United States Federal government has made two attempts to establish an income tax.

Income taxes in the United States. The first was a war measure, and was repealed as soon as the pressing necessity was removed. The second was, like the English income tax in 1842, a means to make up the

estimated deficit resulting from the repeal of the protective duties. It failed to go into effect, however, as the Supreme Court could not be convinced of its constitutionality.

We shall consider the civil war tax first.¹ The constitution provides :

“No Capitation, or other direct, Tax shall be laid, unless in Proportion to the Census or Enumeration hereinbefore directed to be taken.” Article I., sec. 9.

Also, “Representatives and direct Taxes shall be apportioned among the several States which may be included within this Union, according to their respective Numbers, which shall be determined by adding to the whole Number of free Persons, including those bound to Service for a Term of Years, and excluding Indians not taxed, three-fifths of all other Persons.” Article I., sec. 2.

And, “. . . all Duties, Imposts, and Excises shall be uniform throughout the United States.” Article I., sec. 8.

Early in the search for revenues to support the war a proposition was made for the apportionment of a tax of \$30,000,000 in accordance with these provisions. But it was felt that population *The civil war* was no measure of the wealth of the dif- *income tax.* ferent States, and that such an apportionment in 1861 would not result, as one in 1789 might have done, in imposing fairly equal burdens upon all the citizens. In lieu thereof, an income tax of 3 per cent on all

¹ See *Quarterly Journal of Economics*, VIII., 4; also July, 1889.

incomes with an exemption of \$800 was voted. In the case of *Springer v. the United States*, 102 U. S. 586, the Supreme Court decided that such a tax could be levied since it was not a direct tax within the meaning of the constitution.

The tax was to go into force a year later. But in 1862 it was amended, making the deduction \$600 and the rate progressive. Incomes from \$600–\$10,000 (less \$600) paid 3 per cent, all over that 5 per cent. In that form it went into effect. The great war tax law of June 30, 1864, made the rates as follows: 5 per cent on the excess over \$600 up to \$5,000; 7½ per cent on the excess over \$5,000 up to \$10,000; and 10 per cent on the excess over \$10,000. But again, before the law went into effect, the 7½ per cent rate was cut out and 10 per cent was collected from all incomes over \$5,000. On all incomes derivable from the public funds¹ the tax was stopped at the source. In 1867 the tax was reduced and the rate made 5 per cent with an exemption of \$1000, and it remained thus until 1870. The income tax was, in a way, conjoined with one on corporations, banks, insurance companies, railroads, etc. The part of the individual's income taxed in this latter way was deducted before the income was assessed. No attempt, however, was made to make the rate of this tax progressive. It was first 3 per cent and later 5 per cent, and there were no exemptions. The assessment was made on the basis of a written declaration by the tax-payer,

¹ Except interest on bonds.

subject to correction by such information as the assessor could gather. Generally the information upon which the tax was assessed was published in the newspapers. With the general removal of war taxes in 1870 the income tax fell away. The protective policy, which demanded the retention of the customs duties, rendered it possible to do without the revenue from this source.

The reduction of the customs duties in 1894, and the probability of a falling off in the revenues from this source led to the second income tax.¹ *The income tax of 1894.* The law for this tax, faultily drawn and more or less incorrect in principle, was declared unconstitutional by the Supreme Court in 1895 before it went into effect. The grounds for this decision, which reversed that in the case of *Springer v. the United States*, by which the other tax law had been tested, were that the tax was a direct tax and also not uniform inasmuch as all incomes below \$4000 were exempt. This astonishing decision bespeaks more acquaintance on the part of the Court with economic literature than with the use of language at the time of the adoption of the constitution. As the decision now stands no income tax can be levied by the federal government without a constitutional amendment.

This income tax was to be for five years, commencing 1895. It was degressive, at 2 per cent, on all incomes in excess of \$4000. It was levied upon

¹ *Quarterly Journal of Economics*, IX., 1.

“the gains, profits, and income” of all citizens and residents, “derived from any kind of property, rents, interest, dividends, or salaries, or from any profession, trade, employment, or vocation,” “or from any other source whatever.” Debts, and interest thereon, were exempt. The cost of stocking the farm and home consumption of products were not included. Accretions by gift or inheritance were to be counted as income. All persons having an income of over \$3500 were required to declare their incomes. The individual stockholder in a corporation was allowed to deduct the income from his shares in making his return. Public corporations were exempt, but other corporations were not. State and local taxes except special assessments might be deducted. United States officials were taxed on their salaries. Returns were to be confidential.

It will easily be seen that this was a combination of an income tax with an inheritance and corporation tax. That it would necessarily have worked badly on that account is not clear. The rate was so low and the exemptions so liberal that pretty full returns might have been justly anticipated. The law, however, was loosely drawn, faulty in wording, and even contained clauses taken from the laws of the civil war tax having no possible meaning or bearing in the connection in which they were used. No attempt was made to adjust the tax to the existing burden of State and local taxes.

The taxation of income by the commonwealths of

the United States is rare and entirely without leading principles. In Virginia alone there is a general income tax. It is supposed to be a tax of 10 per cent on all incomes over \$1000. But the returns obtained in this commonwealth are insignificant because of the lax assessment. Partial income taxes, intended to supplement the personal property taxes and to cover the annual saving, exist in Massachusetts, Pennsylvania, Tennessee, and North Carolina.¹

¹ See Seligman, "Finance Statistics," *Publications of The American Statistical Association*, New Series, 8, December, 1889.

CHAPTER X

THE INCIDENCE OF TAXATION

SECTION 1. We postponed a treatment of the question of incidence in connection with each tax, because the incidence of any tax depends upon its place in the system. It seems, therefore, better to treat the subject by itself in such a way that every tax can be considered in its connection with other taxes. The problems of this part of the subject are many and difficult. In an elementary treatise, all that can be done is to suggest methods of study and a very few of the more simple principles.

By the term "shifting" is meant the transference of the burden of a tax from the payer to some other person or persons. By the "final incidence" is meant the falling of the burden, without possibility of further shifting, upon some particular revenue, property, expenditure, or person. This may be illustrated by two very simple cases. An American bookseller in a college town imported some books from England for the use of the students. He paid the duty to the custom house, but collected it again from the students in the shape of an addition to the price of the

Incidence depends upon the system.

The meaning of shifting and of incidence.

books. The bookseller shifted the tax. The final incidence was on the students. In this case, the shifting was expected by the law-maker. It was to save the expense of hunting up and taxing each user of the books in question, that the seller was made to pay the tax, or to be the agent of the government in collecting it. Since the students thus taxed cannot shift the burden, we need not investigate this case further. Again: in California, the commonwealth and local taxes paid by the mortgagee amount on the average to about $1\frac{3}{4}$ per cent. The current rate of interest on the best untaxed loans, in and around San Francisco, is about 6 per cent, but on mortgages, in spite of the good security, it has been almost invariably 8 per cent, or more. In this case, the mortgagee shifts the tax, and its incidence is on the mortgagor. This may be its final incidence, or it may be possible for the mortgagor to shift the burden to the tenant of the mortgaged property in the shape of higher rents, or to the purchasers of the commodities raised on the property in higher prices. This last illustration shows how complicated the problem of incidence may be.

SEC. 2. Each and every tax must be studied in its proper connection if it is desired to know to what extent the aims of taxation are realised. Sometimes the shifting of the tax defeats the general purpose, as in the case of the tax on the mortgagee's interest in

*Shifting may
or may not de-
feat the pur-
pose of the tax.*

California, while in others the general purpose can only be accomplished when the tax is shifted. The process of shifting, like every other economic transfer of burdens, costs something. No person advances the amount of the tax with the intention of transferring it to some other without desiring to be paid for his trouble and risk. Unless the conditions are against him he will succeed in getting paid for it. Thus, the importer of books tries to get a certain profit on the cost to him, which is composed of the price in England plus the cost of transportation and the duty. If the rate of profit or commission which he reckons is 10 per cent, he adds 10 per cent of the duty as well as of the other items. The money which he has advanced on the duty must bring him its share of the earnings. So in the case of the mortgages in California. One-quarter of one per cent interest, or more, is usually charged above the rate plus the tax. If the lender has to suffer the annoyance and run the risk of paying the tax, he will have to be reimbursed.

Shifting is a costly process. Shifting is, therefore, an undesirable and costly process, and is to be avoided unless there is some clear saving, as in the case of the customs duties.

SEC. 3. The aims of taxation, the accomplishment of which shifting may aid or defeat, have been stated in the form of canons. The oldest and most famous are the four of Adam Smith.¹ The fourth of these

¹ *Wealth of Nations*, Bk. V., Chapter II., Part II.

famous canons bears directly upon the problem in hand. Shifting adds to the burden without adding to the revenue coming into the treasury. Sometimes, however, by assessing the tax upon a part of a great economic process and permitting of a certain shifting, the tax is made more productive to the treasury. Now it is clear that the first duty of the fiscal officer is to fill the treasury as quickly and easily as possible. He has, therefore, no right to pass over a tax that is productive, in favour of one that is not, simply because the one is shifted and the other is not. If, however, it can be seen that the incidence is such as to entirely derange the system adopted and defeat the general aims, an attempt must be made to prevent it. If a tax can be found that is productive and at the same time is not shifted, it will be preferred to one that is shifted.

It follows directly from the fact that a tax should be as "productive" as possible, that those taxes chosen should have as little repressive effect as possible.¹ For, to destroy the phenomenon is to lose the return.

SEC. 4. Let us suppose that the ideal by which all systems are to be tested is that the total taxation shall impose a slightly progressive burden upon all

¹ See Bastable, pp. 388, 389, for the same idea; also Ross, "A new Canon of Taxation," *Political Science Quarterly*, VII. This is no very new canon. Adam Smith said: "Taxation should retard as little as possible the growth of wealth."

incomes. Then it is necessary to examine all the taxes with their various shiftings and to see how the total shifting affects the final result.¹ It is a fundamental principle, too often overlooked in the discussion of incidence, and one that cannot be too frequently restated, that the possibility of shifting depends largely upon the relation of the tax in question to the other parts of the system. Let us use an old illustration: the tax on mortgages is in California shifted to the mortgagor because there are other investments for capital that escape taxation. If every possible channel into which capital might go led to the payment of a similar tax, it would not be so possible as it now is to shift this tax. It is not quite true that the tax would not be shifted at all, but it certainly could not be so universally shifted. We shall see later when it may be shifted. If we had a tax system so arranged as to fall, in the first instance, upon all parts of each individual's income, — an unattainable ideal, — there could be but little shifting. But when a part of the nation's wealth is exempt, taxes upon all wealth that might be transferred into this exempt form are peculiarly liable to be shifted.

¹ There have been many theories which have undertaken to explain the final incidence of all taxation on some other plan than that of an examination of all the different taxes. Professor Seligman discusses ten different classes of theories in regard to incidence of which only two require this method. See *Shifting and Incidence of Taxation*.

SEC. 5. We shall now look at the incidence of the more important taxes, taking them in the order of our previous discussion. Excise taxes and customs duties, so far as the latter yield a revenue *Shifting of excise taxes and customs duties.* and fall upon citizens of the country laying them,¹ are for our present purpose the same. They are classed by Professor Seligman as "virtually one form of the profits tax," which, "in the great majority of cases," will be "shifted in whole or in greater part." What Professor Seligman says upon this point² is true enough and very clear, but we shall follow an entirely different analysis.

In the case of these taxes it is the intention of the law-maker that the tax shall be shifted to the consumer. If any of it remains on the producer or importer, it may be said to have been shifted back. This takes place sometimes: (1) if the taxed commodity is produced as a monopoly, and the price is already as high as the traffic will bear, *i.e.* the addition of the tax to the price would lessen the sale, then a part or the whole of the tax comes out of the profits of the monopolist; (2) a new tax on some commodity produced by a large plant of fixed capital, not easily transferable to other lines, may remain on the producer. In all other cases an excise or an import tax cannot be shifted from the consumer.

SEC. 6. The general property tax consists of a

¹ See Chapter VII. for shifting to foreigners.

² See pp. 140 ff., and p. 177.

number of different parts which are best considered separately. Such a separation is legitimate since the tax falls apart in the practice of assessment. It falls naturally into at least two great divisions, a tax on real estate and a tax on personal property. The tax on real estate may be regarded as of two parts, a tax on land and a tax on buildings. In the general property tax, the tax on land is assessed according to the selling value. When the land is used for agricultural purposes the incidence of the tax lies between the owner and the user of the commodities produced.¹ Can the owner shift the tax to the consumer? If this happens, it means a rise in prices which again means an extension of the margin of cultivation, marginal lands being untaxed, as having no price, or less heavily taxed. But such a rise in price may affect consumption and lessen the demand at the same time that it tempts to the creation of a new supply, thus inducing a fall in prices. But as cultivators of land do not readily withdraw from their position, those on or near the margin of cultivation will suffer severely, but will generally hold on until their profits are gone, often until they are ruined. The conditions under which agricultural products are sold to-day are beyond the control of any one set of producers. The full burden of the taxes

¹ For America, the tenant may be considered as a consumer of utilities, residence, etc.; so few farms, or productive lands, are rented that they need not be considered.

upon agricultural land, therefore, falls upon the farmers. In the United States, inasmuch as the farmers are seldom the owners of any considerable amount of untaxed personal property, they bear far more than their proportionate share of the commonwealth taxes and often also of the local taxes.

When land is used for other purposes than agriculture, it is generally best considered in connection with the buildings on it. The incidence of the general property tax on houses and the land they occupy will vary from locality to locality with the demand for such houses and the supply. Houses cannot be readily torn down or fundamentally altered without great loss: consequently if the supply of rentable houses is larger than the demand, the tax on the buildings will fall wholly on the owner. It can be shifted to the tenant only when the supply of houses is very limited. In America these two cases are both frequently illustrated.

The incidence of that part of the general property tax which is assessed upon personal property or upon invested capital is very difficult to trace. If the tax were well and universally assessed upon all such capital, it could not, regularly, be shifted from the owner at all. There is no free field for this capital to invade. But when the tax is evaded by a considerable proportion of the capital, then the tax

In the United States the farmers are overtaxed.

Incidence of a tax on buildings.

The incidence on personal property.

can be shifted to the borrower and will be so in the main.¹

It will be seen even from this brief statement of the facts of shifting concerning the general property tax that the incidence is different from the intended incidence wherever that tax fails of forming a complete system.

SEC. 7. The incidence of a land tax like the English differs somewhat from that of the land tax as part of the general property tax, inas-
The incidence of a special land tax. much as it stands entirely apart from the system. Still there are some points in common. Both these taxes may be capitalised. That is the taxed property will sell for less than it would bring untaxed by the amount of the capital sum which, if put at interest, would yield the amount of the tax. In the case of the general property tax, which really falls upon well nigh all land of any value whatever, the tax as we have seen falls most heavily upon the producer of agricultural commodities. But the English land tax has been capitalised and was paid for all succeeding owners by the owner at the time of its assessment, since it did not affect all lands and has become a fixed charge upon the property. The same is generally true of all taxes upon land which are in addition to a regular system of taxes a part of

¹ For the rest of this intricate subject the student is referred to the larger treatises.

which covers the revenue from land. The same may be said of a special building tax.¹

Special taxes upon certain forms of fixed capital, especially when they stand beside a general system which is fairly universal, may be capitalised in the same way. The incidence of taxes on profits is determined by the control which the recipient of profits has over the profits. If the control is so great that he can virtually raise them at will, then he can shift the burden. But, inasmuch as it is generally true, that he is taking all that he can whether he be taxed or not, it is clear that he cannot as a rule shift them. Generally speaking, then, taxes upon profits are not shifted. A tax on successions, also, cannot in any conceivable way be shifted.

*Incidence of
special taxes
on capital.*

Poll or capitation taxes cannot be shifted at all. The only conceivable case in which they might be shifted is when levied upon a wage-earner at the point of starvation. The same is true of a tax on the lowest wages.

*Shifting of
poll taxes and
wages taxes.*

The burden would mean higher wages in order for the labourer to live and meet the tax. But when the wage-earner is of a higher class, it is to be presumed that he cannot shift his tax at all, for that presupposes that he can control his wages sufficiently to raise them. If that were the case we may safely assume that he would raise them whether the tax

¹ See Seligman, p. 117.

were imposed or not. He cannot therefore shift them at all.

A tax upon income cannot be shifted if the assessment is general and uniform. But as a matter of fact no such tax is general or uniform, and it will be shifted or not according as it splits up into other taxes upon rent, interest, wages, etc.

In conclusion: the intention of the law-giver as to the incidence of taxation will be fully realised only, (1) when the system is theoretically perfect, and (2) when the execution of the law is perfect. The worst cases of shifting arise when serious gaps are left in the tax system, or when the administration of the system is so lax in parts as to result in a crippling of the whole. Shifting always acts to intensify existing inequalities. The problems of incidence are among the most important of our subject. The law-maker may with the best of intentions work the greatest imaginable injury; and the necessity for a careful study of the probable effects of each new tax cannot be over-estimated.

CHAPTER XI

FEES AND INDUSTRIAL EARNINGS¹

SECTION 1. There is the closest sort of connection between fees and the industrial and commercial earnings of the State. In the case of the sale of goods or services by a State the private persons pay the price of the wealth which they obtain. The price is fixed by economic conditions. It cannot exceed a certain sum, for if it does the citizen will not buy. But in most cases considerations of a public character induce the State to enter upon the industry or commercial enterprise, and these very considerations are inducements to a lowering of the charges. As the public element comes to be more clearly recognised, a part of the economic forces fail to act. The State sacrifices part or all of the gain, but makes no loss. As the public element presses still more to the front, the State pays, at the general cost, a part of the expense, and charges the particular persons specially benefited merely a fee for the service. Many modern public institutions have gone through a process of development from one stage to the other, and the different stages are found contemporaneously

¹ For definitions and classification see Chapter II.

in different countries. But while this is the order of progression in new functions, it is not the historical order of the rise of these two forms of payment for public services. Fees are the older of the two.

Fees are not to be found in the ancient civilisations, because of the intimate relation between the individual and the State. Only when *Fees and the consciousness of "public" life.* there is a distinct consciousness of "public" functions can we have fees. Payments in the middle ages for the services of the courts, of the church, of the schools, etc., were mainly of the nature of private remuneration. As soon, however, as any function comes to be recognised as public in character, fees arise. At first contributions are more or less freely and willingly rendered for the use of markets, roads, bridges, protection, and the like. Frequently there is an arbitrary assumption made that a special benefit is conferred and a fee is charged. As the State emerges from feudalism, the growth of public consciousness is marked by a rapid multiplication of these fees, which form a system of public revenues without taxes. After that the line of development is in the direction of the curtailment of the fee system and the growth of the tax system. Fees mark the transition stage in the division of labour in the public service. There is a growth of the conception of common benefits as distinct from special private benefits, and a corresponding removal of functions from one to the other category. At the same time new functions arise which are supported

by fees, until finally the recognition of public interest outweighs that of the individual interest. Some fees, however, become fixed in *Fees emerge* character and are not subject to these *into taxes.* transforming tendencies; but the public interest is recognised in this case by limiting the fees to a very small part of the total cost. Thus many court fees are retained, but the larger part of the rapidly growing expenditure for the support of justice is now met from taxes. Those functions, in connection with which there are fees, are regarded as conferring a divided benefit. The individual pays for what he receives, the State for what the public gains thereby.

SEC. 2. The extension of the fee system by the courts to cover a very large part of the cost of the judicial system, even to such a degree as *Judicial and* to make litigation impossible to all but *legal fees.* the rich, was a transition stage in the development from the middle ages to the present. Nowhere was the fee system for court costs more abused than in England. Later practice, while placing more of the burden on the general treasury, has retained an extensive tariff of such "costs." Moreover in not a few instances, the assessment of the "costs" upon the party responsible for the litigation, as shown by the fact that he loses his suit, makes these fees approach in character punitive fines. This is the characteristic of American practice. In many cases the special benefit conferred is not

very clear, but is arbitrarily assumed to exist and the fee levied as though it were for such benefit.

Since the middle of the seventeenth century, a large part of many of the legal fees have been collected by means of stamps or stamped paper, the latter being necessary to legalize the transaction ; the officer who furnished or cancelled the stamp being supposed to investigate and vouch for the propriety of the transaction. A notary's fee in most of the American commonwealths is of this character, the fee being receipted for by a stamp embossed upon the paper. Similar fees or taxes on acts and transfers are very common in France. Other such fees are collected in the form of the sale of a license to perform certain acts which would not be legal without such a permit ; and then there is a charge for recording the act after it has been performed in accord with the permit. Of this character are the fees for marriage licenses and recording of marriages. The act itself is, also, often subject to the payment of a tax. The general character of the legal fee is seen from the following list : fees for passports and similar papers of identification, fees for recording and legally recognising births, deaths, marriages, and divorces, changes of residence or legal standing, for papers in evidence of honours, degrees, orders, titles, offices, etc., for patent rights and copyrights, for consular services in vouching for invoices, etc.

SEC. 3. Many of the acts of the various adminis-

trative departments are of such a character as sometime to confer a special benefit upon individuals for which a fee is charged. The police *Administrative fees.* may render extraordinary services as in the protection of property on special occasions, on the control of masses of people, preventing intrusion, etc. Examples of these special services are very frequent. The same is true of the special services of detectives for private persons.

Fees for public education are gradually falling into disuse. They were originally charged for all grades of instruction from the lowest up *Educational fees.* to the university. The importance of primary education to the general welfare of the people and to the prosperity of the State, when governed by popular franchise, led to the abolition of fees for that grade of instruction at a very early date. In England, owing to the prevalence of an extreme *laissez-faire* view upon this subject, fees for education were continued longer than in most countries, having only very recently been entirely abolished. In the higher grades, wherever such were in charge of the State, fees were retained much longer than elsewhere. The great universities of the American commonwealths have set the example of free tuition for their thousands of students, although they still retain a number of small fees for registration, diplomas, and certain incidental expenses connected with laboratory and similar instruction. European State universities

still generally retain the fee system for most of the lecture courses. Schools intermediate between those giving rudimentary education and the universities are generally managed without fees, like the lower grades. Educational functions of governments seem to have been going through the same transformation which roads have gone through. Already the larger part of the cost is met from general taxes and but a small part from fees. Finally the remaining fees will fall away.

In those countries in which the State supports the churches, or churches of a certain denomination, there are a number of fees connected
Church fees. therewith, such as those for the use of churches and church-yards, for baptisms, christenings, marriages, burials, confirmations, and communion. The means for meeting the rest of the expenses are drawn from two sources. A part is sometimes taken from the general taxes or from special taxes collected for the purpose, and the remainder from voluntary contributions by the attendants, or from the sale of sittings and the like. This is the only important remnant of voluntary contributions in any part of the financial system. In most instances the voluntary contributions are for special purposes, organised charity, missions, etc., which are, perhaps, not properly considered of a public character.

The fees rendered by individuals in connection with their industrial and commercial enterprises are

very numerous. The oldest and simplest are charges for the use of market places, later for the use of public exchanges, etc.; then come the charges for statistics collected by public officers, and the charges for the use of bridges, roads, quays, etc. The modern substitutes for roads: railroads, canals, street railroads, omnibuses, are already passing from private into public hands and the period of transition is marked by a more and more extended use of the fee system. Other means of communication, the post, the telegraph, and the telephone, are of the same character. Fees for coinage are also for services to commerce. They are in use by every country in some form or other. In the United States the charge for coinage was one-fifth of one per cent. England allows the Bank of England to make a similar charge when advancing notes upon bullion, and to set the price in notes for gold coin and gold bars. These fees must not be confused with the charges known as seigniorage, the latter being a tax upon commerce.

SEC. 4. One of the most important classes of fees is formed by special assessments. They are for some benefit to real property. A special assessment is a fee paid to cover the cost, less that of supervision by a salaried public officer, of a specified improvement to property undertaken in the public interest. In his excellent study on this subject Mr. Rosewater¹ tries to establish a difference

¹ *Columbia College Studies*, II., 3.

between fees and special assessments. He admits the similarity, but points out that special assessments are restricted in purpose and in place, are apportioned among the members of a class, are assessed once and for all and for benefits to real property only. Professor Seligman makes the same distinction. But it is certainly not defensible on purely theoretical grounds, for the differences are not essential but accidental. We might as well set up a separate class of taxes on marriages, for they are restricted in purpose, are assessed upon members of a class, once and for all, and are for benefits to the family only. Like all other fees, special assessments are imposed by the taxing power, cover both public and private benefits, and do not exceed the costs.

The simplest case of a special assessment is when a street is to be built, with necessary sewers and water-pipes. The costs of this have to be met. There is a public interest in the street as a thoroughfare. Private enterprise cannot be trusted to properly protect the public interest. The city, therefore, must step in. It could pay the cost from general taxes or from tolls, of both of which the specially benefited persons would pay their share. But in that case, temporarily at least, the abutting land-owners would reap an unearned harvest at the expense of their fellow-citizens. It appeals to our sense of justice that they should pay for it. They can always afford to do so,

*Example of a
special assess-
ment.*

as they gain by the improvement. This system has received large currency in the United States, and has according to Mr. Rosewater's extensive investigations given general satisfaction.

Another method has been used to some extent in England. It is similar to that used by private speculators in America, when they open up a new city, or suburb. The city condemns and buys up enough of the land to be improved to furnish, when sold after the improvements, the funds needed. This method has a very limited application.

Special assessments are not frequent in Europe, but do occur. Mr. Rosewater finds them in varied form in France and Germany ; and they are proposed in England under the name of the "betterment" tax. In the last-named country they were early applied to "walls, ditches, gutters, sewers, bridges, etc., damaged by the sea." But not until lately has the principle of measuring the tax by the particular benefit been applied or proposed, and even now the principle is not quite clear. In England the assessment is to cover the cost of the removal of injury rather than the cost of conferring a benefit. In England the cost of improvements is assessed in general taxes from which certain unbenefited districts are exempt. Strictly speaking, the principle is not regularly applied in England at all.

Special assessments not used in Europe.

In the United States this fee finds almost universal acceptance. It is, indeed, remarkably well

suit to the economic conditions of a new country, and renders rapid improvement possible. In some parts of the country there are harmful results that arise from the desire to give property owners full control over the improvements for which such assessments are to be made. Thus, in some commonwealths, street improvements are only made with the consent of the owners of a majority of the property concerned. The result is that streets are opened irregularly, and some of the main streets are untouched while side streets are improved. But this is an evil of expenditure rather than necessarily connected with this mode of collecting the revenue. The abuses of special assessments are few, and, on the whole, it is a part of the tax system of which America can be justly proud. Professor Bastable's criticism (p. 377) of these fees rests upon a misconception of the method of handling the assessments. They are assessed according to the cost of the improvements; the special benefit is the justification of the contribution, not its measure. There is seldom any difficulty in apportioning the cost fairly. No charge need be made for any additional benefit beyond the cost, and the contributor has, usually, a voice in deciding whether the proposed improvement shall be undertaken or not.

In view of the fact that the prevailing theory of taxation in this country is that which we have designated as the benefit theory, it is natural that

Americans should have been the ones to have made the application of the theory in this particular case. The special assessment is applied in just those cases in which it is easiest to measure the special benefit. And although the principle cannot be given a wider application with any degree of satisfaction, it does, in this instance, comply with the demands of justice and equality. It would, moreover, be rather hard to find under the faculty theory any better justification. *Special assessments and the benefit theory.*

SEC. 5. The post was included above among those functions for which fees were charged. Whether that be quite correct or not depends upon the way in which the postal system is run. *Postal fees.* If it is run so as to yield the largest possible revenue over and above expenses, it is of exactly the same character as any other industrial enterprise upon which the State enters. The State sells postal services for the highest price it can get, or rather, for the largest net return. Its profits, the post office being a monopoly, are regulated by the principle of charging what the traffic will bear. But no post office is run on this principle. The importance of the public service rendered has led to the recognition of a large element of common benefit. This recognition has not resulted in the entire abandonment of charges for the service except in a few instances; for example, the free carriage of newspapers in the county in which they are published. But it has led to the attempt to run the service in

such a way that expenses shall be met, and only a small surplus, if any, shall accrue to the benefit of the treasury. Whenever the surplus tends to grow, the rates are lowered or the service improved. Of all the powers, Great Britain is the sole exception to this rule, about one-third of her postal receipts being profits. (1895, receipts £10,760,000, expenses £6,869,000. But the allied telegraph service ran behind; receipts £2,580,000, expenses £2,674,000.) The postal rates in Great Britain are as low as in other countries, but the surplus is accounted for by the extremely small size of the territory covered by the land service, the concentration of population, and the cheapness of water transportation, all of which makes it particularly easy to do a large and profitable business at low rates.

There are some writers who regard any surplus acquired in this way as practically the result of taxation, and class any charge for the public service, above the cost thereof, as a special tax. This classification presupposes that the service is, by nature, of a public character, an assumption contrary to the fact, for no function except that of governing itself, in the narrowest possible sense, is *by nature* of a public character, nor, on the other hand, *by nature* of a private character. On this consideration, therefore, it is better to class these gains, not as taxes, but as the earnings of a public industry.

SEC. 6. In modern times public industries can be

quite as properly considered under the head of expenditure as under that of revenue. Historically, State industries, like public or princely domains, lands, forests, and mines, were mainly sources of revenue. But a railroad is placed in the hands of the State primarily because of the public interests involved, and the expenditure for that purpose is more significant than the moderate surpluses that accrue, in some cases, to the government. For that reason we called attention to these activities under the head of expenditure. We have now to consider them as productive of so much total wealth, a part of which is immediately spent for the purpose which led the State into this activity, and a part, generally a very small part, saved to assist in the accomplishment of other purposes.

The oldest form of public property is land. The public land originally embraced all the territory of the State. Gradually parts of it were alienated to a private purpose subject only to the law of eminent domain; but considerable portions even to the present day belong to the State, or what is the same thing, to the local governments. In the monarchies of Europe such lands were once considered the property of the prince. These lands were the main reliance for public revenues in the feudal State. As the people gained a voice in the government they laid claim to these sources of revenue for public purposes. From that time on,

Public industries not primarily for the sake of revenue.

Public lands.

the public domain diminished both absolutely, by sale or alienation, and relatively as the wealth of the people swelled. Some countries adopted a very conservative policy in this respect, and retained their domains in land and forests, while others adopted the plan of steadily disposing of them. German states are examples of the former policy, while England, France, and the United States have been examples of the latter. England receives only £400,000 annually of "Woods, Forests, and Land Revenues of the crown." In the United States it was the possession of vast tracts of land by the federal government, acquired by gift from the commonwealths, and by purchase, which gave that government an independent territory over which its control was absolute and formed one of its strongest supports, contributing most materially to the growth of federal influence. But the public lands have not been a source of revenue to the government. The money received from settlers has amounted to little more than fees for the registration of titles, and except for the ten years from 1830 to 1840 the lands have not yielded a clear revenue. The extensive surveys which the government carried out have been a large expense attributable to this source. Under constitutional government there is little danger of the failure of taxation as a permanent and regular source of revenue. So that public lands are not regarded as necessary for the integrity of the government. The retention of public lands in Germany

and Austria is not explainable by any danger of the failure of taxation, but by the greater tenacity of the older communistic idea. Democratically governed cities and towns cling to their lands as strongly as the royal governments. Prussia's public lands and forests yield about 50,000,000 M. annually after all expenses have been met. Cities and towns get as much more, and in many cases supply burgher families with wood without charge. In Russia the process of emancipating the serfs has changed the receipts from public lands into taxes, and left practically little revenue of the older character. In spite of the absence of constitutional government Russia has gone faster, in proportion to wealth and revenues, in the abolition of public domains than many German states. Russia's gross receipts from domains are about \$12,500,000, while Prussia's are nearly \$22,000,000. The alienation of public lands in Russia is recent, and it has progressed as that country advanced in civilisation.

Except when in charge of a highly trained body of expert officials, as in Germany, the public lands do not form a satisfactory source of revenue. They are not as a rule as well managed as similar lands in private hands. Forests form an important exception to this statement. A private owner cannot afford to wait long enough for economical use of timber land. The destruction of forests at private hands is a seri-

No reason for the retention of public lands to-day.

Public control of forests a public necessity.

ous danger. Only a permanent, long-lived institution like the government can take proper care of forests.

Closely allied with the public ownership of lands and forests is the public ownership of mines. This is *Ownership of one of the oldest State industries, which mines.* is of late falling into disuse. The working of mines by the government is being replaced in Europe by a system which allows of private operation, but guarantees the public interest by the collection of royalties, or mining taxes. In the older countries, where the idea of public territorial ownership is stronger, the old system still prevails, and, even where it is partially surrendered, the revenues derived from royalties and taxes are proportionately large. But in the new countries of the American continent and Australia private ownership generally prevails, and no more revenue is derived from this source than from any other taxed industry. The feudal idea of territorial ownership, a remnant of of which still survives in those countries of Europe which retain their interests in the mines, is very different from that of private ownership in fee simple as in America. This accounts for the difference in the revenues from this source.

SEC. 7. But while the modern State has surrendered the extractive industries, a great many others *Other industries.* have been undertaken, not so much as sources of revenue as because of the importance of the public interests involved. Be-

fore this century the most striking instances are of the production of some commodity needed for the public service or of articles of an artistic and costly character. Examples of the latter are the Gobelin tapestries and the Sevres ware. In supplying arms, forts, vessels, public buildings, and the like there is no uniformity of practice among the nations. In only a few cases is the method regularly that of government production. There is a similar absence of uniformity in practice in regard to all those industries which involve large public interests for the conservation of which there is under private management no good guarantee. In some cases, as the water supply, there is a general tendency in the direction of public ownership. Whenever, as in this case, a public interest is absolutely paramount to every other consideration, there is little attempt to make the industry a source of revenue beyond what is necessary to maintain the service. These industries, therefore, tend rapidly to be supported by fees or taxes. Inasmuch as it is generally the importance of the public interest that led to the assumption of the industry by the government, this tendency is universal. Roads, canals, the water supply, the post office, telegraph, telephone, and the railroads all pass more or less rapidly through these stages according to the importance ascribed to the public interest in them. As already seen, the post office is now primarily supported by fees. The funds for the support of water-works are generally collected

from the users, as fees, or from certain classes of persons as special taxes, but seldom as prices for the service. The experience of nations with State-owned railroads is too recent and too varied to be very instructive. States have been led into the ownership and operation of railroads: first, because the roads needed the support of public credit; second, because of military interests; third, because of the failure of private companies to protect public interests. Railroads have more often been a source of public expenditure than of public revenue. In Prussia alone have the financial results been such as to add materially to the income of the treasury. The question of government ownership of railroads is one involving considerations broader than merely fiscal ones and does not properly belong to our subject. In no case is it at all likely that merely fiscal considerations will have more than a deterrent effect upon the solution of the problem of the government's action in regard to the management of the railroads.

While the industrial, commercial, or other economic functions of the State are of continually growing importance, they are not likely to be largely a source of net revenue. No-
Public indus- try not likely to be a source of net revenue. where do we find principles that would lead us to anticipate that revenues of this character will ever supply the place of taxes. Indeed, if the usual evolution continues, these functions may be performed by the State without a special charge

upon the benefited persons, and, while the liberties of the people in respect to the enjoyment of these facilities will be greater, the burden thrown upon general taxation will be equally so. If a city now supplies a sewer system to citizens free of special charge except for first construction, it may with the same logic supply water. If a State furnishes roads at common cost, it may certainly so far modify the management of railroads as to apply the fee system and forego the collection of any surplus, though in this case, as in that of the post office, there would seem to be as yet no sign of any tendency to go beyond the fee system.

PART III

PUBLIC INDEBTEDNESS

CHAPTER I

THE GROWTH AND NATURE OF PUBLIC CREDIT

SECTION 1. The national governments of the civilised world to-day owe more than twenty-seven and one-half thousand millions of dollars, or five and one-half thousand million pounds sterling. With the addition of the debts owed by the local governments this sum exceeds thirty thousand millions of dollars, or six thousand million pounds. The exact figures according to the Eleventh Census of the United States are :

National debt of all countries	.	.	\$27,524,976,915
Local debt of all countries	.	.	2,824,950,694
Total	.	.	<u>\$30,349,927,609</u>

According to the best authorities the national indebtedness of the world has increased fourfold since 1848.

Years.	Aggregate debt.	Increase.	Per cent of increase.
1848 . .	\$7,627,692,215		
1860 . .	10,399,341,688	\$2,771,649,473	36.34
1870 . .	17,117,640,428	6,718,298,740	64.60
1880 . .	27,421,037,643	10,303,397,215	60.19
1890 . .	27,524,976,915	103,939,272	.38

[From the Eleventh Census.]

The increase of national indebtedness since 1880 has been comparatively slight. But this is partly due to the payment of a large part of the national debt of the United States. Other countries have continued the process of debt-making — although less rapidly, owing to the continuance of peace. The above figures do not include pensions, which are really debts in the form of annuities.¹

While the absolute amount of the debt has increased, the burden has materially decreased since 1880, owing to the increase in popula-
tion and wealth. In 1880, the national
indebtedness of countries other than the

*The burden
has decreased
since 1880.*

United States amounted to \$35.64 *per capita*, while in 1890 it was \$32.90 *per capita*. The national debt of the United States was reduced absolutely by over a billion dollars, and relatively from \$38.33 *per capita* to \$14.24 *per capita*. Of course statistics of this sort are neither perfectly accurate nor easy to interpret. The only proper comparison between different countries would be that of the ratio of the

¹ If these were included and capitalised at ten years' purchase, which would, perhaps, be a fair average, they would add to the debt of the United States at least \$1,400,000,000.

interest charge to the annual income of the people. But the annual income is very difficult to ascertain, and the errors would, probably, be so great as to destroy the significance of the result. But these figures, while not absolutely correct, are sufficiently so to indicate that the policy of borrowing has become a most vital part of the system of public finance. The cause of these debts is almost exclusively war and the preparation for war. If the expenses of war and its preparation had been excluded from the finances of most nations, and the finances relieved of the subsequent burden of interest, civilised nations would have been easily able to meet their current expenses. In England the annual public-debt charges for interest and debt payments consume more than one-fourth of the annual revenues from every source; £25,200,000 out of £97,297,361. The policy pursued by England is to make the debt charge permanent at that amount, using all that can be saved over and above the interest charges for the payment of the principal. The funded debt of France, the largest ever contracted by any country, imposes an interest charge of \$176,461,275 upon a total revenue of \$650,372,370. If we include certain annuities and pensions, more than one-third of the revenues of France are consumed in this way.

Germany is the only country of importance that does not now rely entirely upon the possibility of borrowing money in case of war. That country has

a special cash reserve of \$30,000,000, which is available for immediate application to war purposes should it be needed. Although the *Germany's* German Empire began in 1871 without *cash reserve*. debt, it now has a debt of \$85,000,000 in excess of its available assets. This is all due to armament. So that, although Germany holds a cash reserve for military purposes, it is practically a borrowed one and she is making her preparation for war on borrowed money. This policy does not differ essentially from that of other countries. In the middle ages, however, as in classical times, it was the practice of nations to accumulate a treasure for war purposes in advance, by collecting more revenue each year than was needed. This practice is now obsolete and is also indefensible as too costly.¹

Modern nations, then, practise a method of deficit financiering. They make provision in their annual revenues for the current, regular, or *Deficit financiering*. "ordinary" expenditures only, and rely for funds at other times upon their ability to borrow. What then constitutes this ability to borrow upon which so much reliance is placed that even the very existence of the nation is allowed to depend upon it? Since when, and how is it that nations have been able to rely so absolutely upon public credit? The answer to both these questions is contained in the analysis of public credit.

SEC. 2. Public credit is only one form of general

¹ See Bastable, p. 567.

credit, and it is comparatively easy to point out wherein the former differs from the latter. But credit in itself is by no means easy to define. Scarcely any two of the able writers who have treated the subject are agreed as to its most important features. It has, moreover, as a term in common use, suffered so many subtle changes in meaning in the course of its history as to leave its modern significance full of dangerous variations. The ordinary business man uses the word daily to convey half a dozen or more different ideas without recognising the differences. Scientific writers have waged long and bitter controversies concerning its proper definition.¹ Without going deeply into the controversy, we may say that there are practically three opposing views as to the real nature of credit. First, there are those writers, who, like Nebenius and Rau, start from the etymological meaning of the term and maintain that the confidence, or trust, reposed by the creditor in the ability of the debtor to fulfil an agreement in the future is the chief element in credit.² Second, there is a class of writers who, like Knies, regard this element of confidence, a mere psychical condition, as

Public credit a form of general credit.

Difficult to define credit.

Three opposing views as to the nature of credit.

¹ A good idea of the extent of the controversy and of the conflicting views can be gained from Knies, *Der Kredit*, Berlin, 1876.

² Nebenius, *Der öffentliche Credit*, Carlsruhe und Baden, 2d ed., 1829; Rau, *Finanzwissenschaft*, 3d ed., Heidelberg, 1851; II. Abt, p. 248.

too intangible, too immaterial, to be of any value for a scientific definition. They proceed entirely from observation of those transactions which are said to involve the use of credit, and find in all such transactions one feature which is never present in transactions not designated as credit transactions. That feature is that the completion of the transaction is regarded as being postponed to a future time. This element of time, this postponement, must then, they argue, be the essence of credit. Credit is, in their eyes, merely a means of transferring ownership temporarily, a means of paying for present goods with a greater quantity of future ones. Third, there is still another school, who, like McLeod, regard credit as analogous to money, money being regarded as representing claims on the wealth of the whole community, while a credit is a similar claim on the wealth of some particular individual. McLeod even goes so far as to identify the claim, the order, the promise to pay, or the right to demand with "the credit." "A credit," says McLeod, "in Law, Commerce, and Economics, is the Right which one Person, the Creditor, has to compel another Person, the Debtor, to Pay or Do something."¹ Professor Sherwood has developed this in a more scientific manner.

¹ *Theory of Credit*, I., 315. In a very scholarly article published in the *Quarterly Journal of Economics*, January, 1894, Professor Sherwood discusses the nature and mechanism of credit in a way to throw a great deal of new light upon the subject. I do not believe that his analysis can be improved upon. He distinguishes particularly the credit basis of money, as generic or

SEC. 3. These definitions, apparently so contradictory, are not altogether irreconcilable. They *Reconciliation of these views.* represent different points of view rather than real differences in meaning. Certainly nothing but credit is described by any one of the three definitions, and certainly there are shades of the meaning of the term that are aptly described by each of them. As is so often the case when a word in common use is defined for scientific purposes in several ways, we find that one definition fits certain classes of things covered by the term better than others. There are certain debts, for example, in which the element of trust is paramount, others in which that of time is more important, and again some in which the element of claim or demand is the distinguishing thing. But it is also true that there are no cases of the existence of credit where all three of these features do not appear, the one or the other varying in importance as the case may be. To fully understand a thing so many-sided as credit, it is necessary to examine it from several points of view.

If we start from the etymological meaning of the term we cannot avoid the conclusion that one of the chief elements of credit is trust. Certainly without

universal credit (which he calls "customary credits"), from that of the commonly so-called credit transactions, which he calls "formal credits." It is with the latter only that we are concerned here. They are legally enforceable. They rest in the economic sense "on a psychological trait of faith in the uniformity and reasonableness of other men's voluntary acts,"

that intangible, unmeasurable feeling or frame of mind known as confidence, trust, or faith, on which Knies pours so much scorn, no debts would have come into existence. *Confidence a necessary part.* As Professor Cohn well says, "Credit rests on the development of opinions and institutions which arise with the general advance of civilisation."¹ Modern usage has not yet eliminated this original meaning from the term. It cannot be altogether incorrect to make this a part of the definition. It is customary enough to conceive that credit or faith is reposed by the creditor in the debtor, and that it varies in amount, although never exactly measurable. But there are many credit transactions in which the element of trust shrinks into insignificance. An advance on a warehouse receipt, a Lombard loan, a pawn-broker's advance, all of these and many like them are credit transactions, but the element of personal confidence plays little part in these. The creditor in these cases never has to consider the character of the debtor nor his ability or willingness to pay. After he has satisfied himself as to the value of the security, all that he has to consider is the time the debt has to run. *Time also essential.* It must be admitted, then, that there are a number of cases of credit transactions in which the paramount element is that of time. The first two of the above-stated views of the nature of credit are, therefore, reconcilable in

¹ *Grundlegung*, p. 553.

this way. They may be regarded as essentially the same with a difference in the emphasis, and it is correct to change the emphasis when different kinds of debts are considered. Both of them may be covered by one definition, which may for two reasons be called the subjective definition: (1) Because it takes into consideration feelings, opinions, *i.e.* trust, confidence, belief. (2) Because it looks at credit from the natural point of view of the creditor who entertains that trust.

Subjective Definition. — From the subjective standpoint credit is the confidence or trust reposed by one person in the ability of some other person to fulfil a promise at some future time. The emphasis will fall upon the feature of trust or upon that of time according to the nature of the particular debt in point.

But that is not all: we have yet to dispose of that view which identifies credit with the claim which the creditor has on the debtor. In one aspect this view seems absolutely contradictory to that which we have adopted. So much so that Knies ridicules it, considering it quite as absurd as the reasoning of John Law. He says it makes the debtor give credit: *i.e.* he gives the claim, and the claim is credit. But McLeod's reasoning is not so easily disposed of. He has taken what may be *The objective point of view.* well called the objective view. He has sought out embodied credit. His, too, is the natural point of view of the debtor. The opposition,

therefore, between the two views is more apparent than real, and arises from the fact that this is from a different point of view. There are two sides to the shield. The debtor sells a claim, which is a more or less tangible thing having a present value, just as many another claim has; as, for example, a patent right or a copyright. The debtor is concerned only with the value of that claim. The creditor, however, looks beyond the claim and desires to know whether he can trust in the ability of the debtor to make the claim good. By a very natural analogy, too, the language of business says that the debtor enjoys good or bad credit, as though the trust reposed in him by others, in whose minds it exists, really became an attribute of him. There is still more ground for McLeod's view, for, as has already been remarked, it is often the nature of the claim created that adds to, or detracts from, the credit. Any man in ordinary times can obtain credit if he comes prepared with collateral security and is ready to create a claim that is good on that in case his other resources fail him. It is clear, then, that the view of McLeod is important, and also that it is supplementary to that already adopted. It reveals many phases of credit that cannot be seen at all from the subjective point of view. The two views taken together make a complete explanation.

Objective Definition. — From the objective standpoint, credit is embodied in claims which are ac-

cepted by the creditor in payment. These objective claims have a value like every other exchangeable commodity, and are recorded in the various "instruments of credit."

If these two definitions are accepted, we can proceed to point out wherein public credit differs from ordinary or private credit. The peculiar conditions which distinguish public credit from ordinary credit arise from the fact that the debtor is the State. The State, being above the law, cannot be compelled, as the private individual can, to pay its debts. Public credit is therefore subjectively defined as the confidence or trust reposed in the ability and willingness of the debtor (the State) to fulfil its promises at some future time. Objectively the claim (in this case the bond) shrinks to the character of an unsupported although generally accepted promise. There are, to be sure, some important cases in which the claim is apparently supported by something more definite than the mere promise of the debtor; as for example, when the revenues from certain productive enterprises are pledged for the support of the debt charges. But even in these cases, the creditor has no real resource against intentional bad faith. In general the subjective standpoint gives a better view of public credit than the objective, because the claims cannot be enforced.

The fact that the debtor is the State has other important consequences. (1) The State has sover-

eign power and can compel its subjects to lend to it; or, on the other hand, the creditor may make advances on rather poorer terms than he would otherwise accept, from motives of patriotism. (2) The debtor State lives forever, and hence can make perpetual debts. (3) Its affairs are all open to inspection, and the would-be creditor has full opportunity to know its ability to pay. (4) Public credit may be divided into various parts, according as it is the credit of the central government or of some subordinate department that is being considered. The consideration of the relations of the different parts of the government in this respect belongs to the field of public law rather than to that of public finance.

SEC. 4. Public credit was necessarily later in development than private credit. General habits of lending on a large scale had to be established before nations could borrow. The bankers and brokers of the world had to develop the machinery for handling evidences of debt before large public loans could be placed. Then, too, inasmuch as the objective evidences of debt in the case of the government were nothing but the unsupported promises of the government, confidence that these promises would be kept had to grow. At first the assurance rested on the honour of the monarch, or upon some pledge or security given by him, such as the crown jewels, crown lands, a lease of the revenues, and the like. But

Other differences between public credit and private.

The late development of public credit.

later, as Bastable so ably shows,¹ the development of public credit goes hand in hand with the development of constitutional government. It would seem that the control of the purse by the very persons who were to pay the taxes gave a steadiness and security to the financial administration that aroused the confidence of money owners.

SEC. 5. Much attention has been given by different authors to the economic effects of public borrowing. It is now pretty well agreed that public borrowing does not, as was once taught,² create new wealth except indirectly, through the use made of the capital taken when it is used productively.

Economic effects of public borrowing. Nor, on the other hand, does public borrowing in itself directly destroy wealth. The money borrowed may be devoted to some form of rapid consumption, as in war. In this case the destruction of wealth is determined by the line of expenditure decided upon, not by the borrowing merely. But the feasibility of obtaining large sums in this way is said to lead to more extravagant expenditure than would otherwise be indulged in, since taxation for such purposes would be difficult. The consumed wealth is replaced by claims upon future wealth which are not of such a character as to be available as productive capital. But the loss incurred is distributed over many years instead of being concentrated in a few. As in the

¹ P. 579.

² "The public funds a mine of gold."

case of a spendthrift who mortgages his patrimony for wasteful extravagance, so in the case of a nation which borrows for war, the evil that arises is from the waste, not from the borrowing. For the State to borrow for a productive purpose has no other economic effect than for a private corporation to do the same.

SEC. 6. There has also been some discussion of the relative merits of domestic and foreign loans, and their differing economic effects. *No serious difference in the effects of foreign or domestic loans.* Sometimes it has been claimed that foreign loans involve less disturbance of domestic industry. The intimate relation existing between modern nations in their commercial and industrial enterprises destroys to-day almost all the significance that might formerly have attached to such a discussion. The payment of the French indemnity of 5,000,000,000 francs to Germany after the war of 1870 was carried out in twenty-seven months, and not one single serious difficulty or disorder in the financial centres was produced by it.¹ So great is the mobility of modern capital and so vast are the current transactions, that all of this money could be easily turned into the same stream without disturbing its placid surface.

Public credit is a plant of slow growth; more than that it is a delicate plant. It may be *The frailty of public credit.* injured beyond recovery by a single case of failure to fulfil the promise in which it found

¹ *Blackwood's Edinburgh Magazine*, Feb., 1875, pp. 172-187.

expression. Many of the commonwealths of the United States have repudiated their debts, and have since then recovered their power to borrow but slowly, and in some instances scarcely at all.¹ Weak nations which may be or have been coerced by stronger and wealthier nations in the interest of citizens of the latter who were creditors of the former, generally borrow more easily than stronger independent nations, or parts of strong confederations, which have failed to meet their obligations and cannot be coerced.

The credit of local governing bodies depends in great measure upon their powers and duties in public law. Generally speaking, a "municipal corporation," when acting legally within the sphere prescribed to it, is like a private company;—its obligations can be enforced by legal or judicial procedure. Unlike the sovereign State, a municipality can be sued without its consent. Only with the positive sanction of the sovereign State can a municipality default and escape punishment therefor.

¹ Under the Eleventh Amendment to the Federal Constitution, a State cannot be sued in a federal court. This is contrary to the original intention of the constitution. See my monograph, *Das Kreditwesen der Staaten und Städte der Nordamerikanischen Union in seiner historischen Entwicklung*, Jena, 1891. Egypt is a good example of foreign coercion to enforce debt payment.

CHAPTER II

FORMS OF PUBLIC DEBTS

SECTION 1. Governments may borrow money in almost any of the ways which an individual may use. These different forms can be best made clear in connection with their classification. The principles upon which a correct classification should be built are those developed in the preceding chapter. Public debts are forms of public credit, and the kind of credit upon which each debt is based should be shown in the classification. Some light can be thrown on the different forms of debt by a review of the older classifications. One of the commonest distinctions is that between funded and floating debts. Originally this distinction was very simple, and correspondingly useful. In the words of Adam Smith: "Nations, like private men, have generally begun to borrow upon what may be called personal credit, without assigning or mortgaging any particular fund for the payment of the debt; and when this resource has failed them, they have gone on to borrow upon assignments or mortgages of particular funds." The first of these is the unfunded debt, the other is the funded

*Classification
should show
the credit up-
on which each
debt rests.*

*Funded and
unfunded
debts.*

debt.¹ But although these terms are still in common use, the meaning attributed to them has so entirely changed, that to-day the so-called floating or unfunded debt consists, in large part, of outstanding claims upon very definite revenues, while it is often the case that no particular fund or source of revenue is directly pledged for the payment of the so-called funded debt. Hence it is that Professor Cohn treats Smith's grounds of distinction as antiquated, and says that the real distinction is found in the fact that the funded debts are those of longer duration, and the floating debts those of shorter duration, "although," he adds, "different causes and purposes of credit lie behind the difference in duration."² The most elaborate attempt *Wagner's* to explain the modern uses of these *distinctions.* terms is that of Wagner. As it is so complete, it is well worth summarising here. Funded and floating debts can be distinguished by the following characteristics, which are more or less clearly recognisable in the different cases: (1) The purpose of the loan — floating debts are generally for rapidly passing needs, especially for the payment of the current dues of the treasury; funded debts are to supply the capital for permanent needs of the civic household; (2) continuance of the debt — together with the former characteristic, relatively shorter continuance of floating debts, at least in intention;

¹ *Wealth of Nations*, V., III.

² *Finanzwissenschaft*, p. 757.

longer continuance of funded; (3) the legal conditions of repayment—in the case of floating debts the different items are repayable at sight or within a comparatively short period; in that of the funded, the creditor has a more limited control over the principal, the debtor (the State) being bound to repayment according to a fixed plan for amortisation, or making no agreement as to the repayment of the principal. This last is regarded as the essential test.¹

The difficulty found in drawing a sharp line between these two classes arises from the fact that the distinction is at best purely an arbitrary one. It may differ from State to State, or from time to time in the same State, according to the temporary whim of the public official or statistician. The terms are relative ones. By a floating debt is generally meant one that is regarded by the person using the term as a temporary one. One official will call any debt temporary, or a floating debt, which has three, five, or even ten years to run; while another will refuse the term to any debt that is to run longer than six months or a year. Strictly speaking, the term floating debt ought never to be applied to any

¹ Most writers make use of these terms; few have defined them so accurately as Wagner. For example: Adams, *Public Debts*, p. 147, concedes the term floating debt only to those in which the government retains the right to investigate each particular claim. This necessitates a new class of "temporary debts," consisting of treasurer's notes, bills of exchequer, and the like. Nothing would seem to be gained by this distinction.

debt that is, on the face of it, to run beyond the end of the fiscal year next succeeding that in which it is created. But there is no established custom for such a limitation. In trying to draw a sharp line between these two classes we meet with the same difficulty that we met in attempting to distinguish between direct and indirect taxes. But we have even less to go upon. Official, statutory, and scientific usage varies so much that nothing is gained by attempting to collate all the meanings. Even for the most general scientific purposes, therefore, these terms are of little value, and for the purposes of classification the distinction is absolutely useless.

SEC. 2. There are two, and only two, ways in which a State may borrow. It may compel persons

Forced loans and contractual. to lend to it, or it may offer terms to which persons agree. The first of these will be called, for convenience, forced loans; the second contractual.¹ This distinction into two classes according to the motives appealed to is primary. The first class consists of loans that are now comparatively unimportant and rare. They were once very common.² Few nations now have

¹ Leroy-Beaulieu, Adams, and Bastable make use of a third class called "patriotic" loans. They have three classes, forced, patriotic, and "voluntary." The need of this second class is not clear. The patriot differs from the other creditors only in that he accepts worse terms, or apparently such. Unless he waive all claim to repayment, in which case there is no debt, his loan differs from those of the third class only in that it is even more "voluntary."

² See Roscher, § 132.

resort to forced loans, even to the limited extent of paying their current expenses in bonds, compelling persons having claims to accept them. There is a quasi-forced loan that is of some interest. That is the use of irredeemable paper money. *Irredeemable* This is very commonly spoken of as a *paper money*. forced loan. It must be observed, however, that it is a loan only when the government making such issues, directly or indirectly, promises to redeem the notes at some future time. Otherwise no debt has been created. When such money is issued with the purpose of retaining it in circulation permanently, it is not, in intention at least, a debt; but it is a form of forced payment more akin to a tax. Even when there is a promise to redeem the money at some future time, this forced loan shows few of the fundamental features of a debt. Every debt involves the use of credit.¹ Now from the subjective side there is little or no credit involved in this case. The trust or confidence amounts to nothing more than a belief in the stability of the government and a readiness to obey its authority. From the objective side the creditor, if we may call him such, receives a claim that is satisfiable not from the goods of the debtor as in other cases, but from the goods of the community, and that by law. Unlike money of "final redemption" these notes cannot properly be said to be based even upon customary credit. From both points of view, then, these so-called

¹ Formal credit, to use Professor Sherwood's term; see note, p. 283.

forced loans are scarcely more than quasi-debts. They are also quasi-taxes. Dietzel maintained that these loans were merely taxes.

SEC. 3. Among the contractual debts the first thing that strikes us is that certain of the contracts contain features especially intended to add to or ensure the confidence of the creditor, while in others there is little or nothing looking to that end. This at once suggests two natural subdivisions of

<i>Divisions of contractual debts.</i>	contractual debts. On the objective side the first class consists of claims good (1) upon particular funds, or (2) upon particular revenues or the revenues of a particular period, or (3) upon certain definite portions of the general revenue permanently set aside to meet them. These three bases for the claims suggest three natural subdivisions of the first class. Of these three again, the second, consisting of those claims which bear upon certain definite revenues, may be most conveniently analysed according to the classification that was adopted for public revenues.
--	--

The most important element of those debts, the contracts for which contain no provisions directly intended to ensure the confidence of would-be creditors, is the length of time that the debt has to run, or what is much the same thing, the relative size of the demands made thereby on the general revenue. Here we find that certain contracts call (1) for the repayment of the principal only, some (2) for the payment of principal and interest, while others

(3) call for the payment of interest only. To shorten the matter the whole classification will now be presented in the form of a table. The names of the classes are generally self-explanatory, but in some cases, for clearness' sake, a concrete or a general example is appended.

I. FORCED DEBTS : (Now mostly obsolete. Akin thereto are the quasi-debts in the form of irredeemable paper money.)

II. CONTRACTUAL DEBTS :

A. The contracts for which contain provisions directly intended or calculated to ensure additional confidence. Such confidence resting :

1. On the fact that the sums received from the creditor are not expended but are retained to meet the debt charges.

These are of two kinds :

a. Voluntary deposits :

1) Without interest. Ex. Post-office orders.

2) With interest. Ex. Deposits in public banks, etc.

3) Insurance (not compulsory).

b. Statutory deposits :

1) Guarantee funds of various kinds, with and without interest. Ex. Deposits by insurance companies to protect policy holders, etc.

2) Insurance (compulsory).

3) Deposits of coin or bullion to secure circulating notes. Ex. United States silver and gold certificates.

4) Estates in hands of the courts pending litigation.

2. On the fact that definitely specified revenues are set aside for the payment of the debt (subdivided according to the classification of revenues).

a. Based generally on the revenues of a definite period. Debts contracted in anticipation of the revenues. Ex. chequer bills and redeemable notes.

b. Based on prices. Ex. Money borrowed for the establishment of some productive enterprises carried on in competition with private enterprises of the same character.

c. Based on fees. Ex. Municipal bonds for water-works.

d. Based on special taxes :

1) By the method of farming taxes (now obsolete).

2) By appropriating special taxes, (or a percentage of all taxes) and putting the funds thus received into the hands of trustees, for the payment of the debt.

B. Where confidence is so assured that no

special means are taken to arouse it. Classified according to the thing promised :

1. Principal only. Ex. Redeemable notes (money) not legal tender, and not assured by any deposit.
2. Principal and interest :
 - a. Bonds sold in the market for what they will bring, and bearing a fixed rate of interest, payable at a set time or in instalments.
 - b. Annuities, terminable at the end of a definite or indefinite period, as a term of years or a life, so calculated that at the end of the period the amount paid shall equal the principal and interest. These may be in many different forms; they may be arranged in the form of life annuities, of pensions, of lotteries, or in that of tontines and the like.
3. Interest only :
 - a. "Perpetual bonds," in the case of which the creditor has no right to demand the payment of the bond within any definite period, but the government may generally, after a fixed time has elapsed, redeem the bonds for a stated sum.
 - b. Permanent annuities.

SEC. 4. In the great majority of cases in modern

times, the leading nations are able to borrow without particular reference to any special means of arousing confidence. The long period through which they have faithfully fulfilled all their obligations has so thoroughly established their credit

Means of alluring creditors. that their bonds stand among the best securities on the market. The only changes that can be made in these debts

are such as are intended to make the annual burden as small as possible. Some of the things desired by creditors, and which, while not affecting the credit of the borrowing State, yet add to the readiness with which the bonds sell, are (1) that the debt shall not be redeemed arbitrarily for a capital sum which would not yield, at the market rate of interest, the same annual income as the bond; (2) that any chance gains that may arise, as from a fall in the market rate of interest, may for a time at least accrue definitely to the holder.

By far the larger part of European debts consist of the so-called "perpetual" bonds. These bonds, which generally name a certain capital sum at which they may be redeemed, contain no date at which they mature. They are redeemable whenever the debtor (the State) chooses, subject in some instances to certain limitations for the greater security of the lender. For example, the publication of notice of intention to redeem or promise not to redeem for a certain period. These "perpetual" bonds are for both parties a very con-

venient form. What they amount to is that the State sells an annuity for what it will bring, with the privilege of redeeming it at any time for a certain sum, but it cannot be compelled to redeem it at any inconvenient time. The creditor, owing to the publication which to-day attends all public affairs, knows what provisions can be made for the repayment, and consequently knows approximately how long his annuity will run. He can, moreover, easily dispose of it through the stock market if he should need the money for other purposes.

This form was once used in the United States, but traditions of rapid payment led to the adoption of different forms.¹ The first debts of the *Early debts* United States had been made in the *of the United States.* form of simple perpetual bonds with no limits. The debts created after the War of 1812 were also of that variety, with a limit of time set within which it was promised not to redeem them. But the variation just referred to was introduced in 1862. This form has been called the "limited option" debt. The bonds were "redeemable at the pleasure of the United States after five years, and payable twenty years from date" of issue. They were called "five-twenties." A similar plan was followed in the so-called "ten-forties." The only advantage gained by thus fixing a limit at which the creditor is to expect the payment, is that the fiscal officers may have a definite goal toward which to

¹ See Adams, *Public Debts*, p. 162.

work. If a termin is set, it is easy to urge the extinction of the debt at or before that time, and consequently the adoption of special means and efforts toward that end.

SEC. 5. Next in bulk are the "terminable" annuities. These may be terminable at the end of a certain period or at the death of the holder. Life annuities, both upon individual lives and upon the tontine plan,¹ are old favourites. But as forms of original loans they are giving way to the perpetual bonds. Life and other terminable annuities have the advantage of affording an easy means of debt payment; and in this respect, on account of the accurate knowledge of the amount to be paid, those terminating at a definite time are the preferable. But inasmuch as the annual payments must be larger than the interest by an amount calculated to equal the principal or cost at the termination of the period, these annuities impose a heavier constant burden upon the taxes. In the case of perpetual bonds no provision is obligatorily made for amortisation, and consequently the fiscus has better control over the expenditure for this purpose. At a time of great pressure on the revenues the perpetual bonds offer a better means of raising money than the terminable annuities, inas-

¹ This plan, now made familiar again by its adaptation to life-insurance business, is to make over in succession to the surviving members of a group of annuitants the shares of the members who die. The last survivor gets the whole amount, until his death closes the account.

much as they will impose a smaller burden for the time being. But when the difficulty is over, it is not infrequently the practice to turn some portion of the debt into the form of terminable annuities, as that imposes upon future officials a fixed policy of debt payment. The investing public finds little or no absolute advantage in this form, for it is relatively hard to save up the principal again, coming as it does in driblets, and the salable value of the security decreases continually, so that the command over the remaining portion of the principal is never good.

SEC. 6. Another favourite European form is that of lottery loans. A somewhat lower rate of interest on the loan is offered than would otherwise be accepted, and the balance of the *Lottery loans.* amount is divided among the holders of the securities on the lottery plan. Inasmuch as this is intended to appeal to the general love of gambling, the bonds are for small amounts, and are sold to the people. The plans for determining the disposition of the winnings of the lottery are varied. A combination of the annuity loan with the lottery loan is made when the State agrees to pay a certain proportion of the debt each year, the determination of which portion of the debt, or of which particular bonds, will be paid being made by drawings.

SEC. 7. In all of these forms of debt-making the chief problem of the practical financier is to fix the rate of interest as near as possible to the market

rate. It is best that it should not be below the market rate, for in that case the bonds will sell for *Fixing the* less than par, and the government will *rate of interest.* have to pay back a larger sum than it receives. This addition is accumulated and compounded interest, which it would, presumably, have been easier to pay in annual instalments than at one time. The amount of the discount at which the bonds will sell depends on the length of time that they have to run.

When the market rate of interest falls, as it generally does in time of peace, below that at which the debt was contracted, it is generally desirable to reduce the rate of interest on the debt. If, therefore, the government can call in its bonds, it goes through the process of refunding; that is, it issues new bonds at the new rate of interest and pays off the old with the proceeds. This advantage is peculiar to the perpetual bonds, and is consequently made use of whenever the rate of interest falls, which fact can be ascertained from the quotations of the bonds on the stock market.

SEC. 8. Perhaps next in importance to the great categories of debts we have been discussing are *Debts of the* those included in the classification as *treasury.* based upon specified revenues (II. A. 2). Of these, only those based upon the revenues of a definite period are common in national financiering. Most of the others, however, are common in local and municipal finances. Inasmuch as taxes are

payable only at certain times of the year, generally only once or twice, while the expenses run on through the whole year, there will necessarily be times when the treasury owes more than it has on hand. Some of these debts will be bills of account; others will be represented by notes of various kinds which the treasurer uses to pay bills with or discounts to obtain money. The latter, called "exchequer bills," "treasury notes," and the like, are generally willingly accepted, and often pass freely from hand to hand. They bear interest at the lowest market rate.¹ They are properly regarded as debts of the treasury rather than debts of the government, and are payable out of the next incoming revenues. These bills may swell to large amounts in times of sudden pressure on the finances, or they may be carelessly allowed to accumulate year by year, until they must be funded, or, perhaps, included in some general refunding or consolidation act.

SEC. 9. Borrowing to secure the means for entering upon some productive enterprise is the chief cause of the debts of local governments. *Productive* Cities borrow to build water-works, to *loans*. construct street railroads, to establish a gas or lighting plant, etc. In the United States the different commonwealths have borrowed to aid in the construction of railroads, or to establish banks. The enterprise in which the funds thus acquired are

¹ In 1894-95 English exchequer bills for March bore interest at the rate of $1\frac{1}{2}$ and 1 per cent. June bills, $2\frac{3}{4}$ and $1\frac{1}{4}$ per cent.

invested furnishes an additional security to the loan, and enhances the credit of the local body, because it is supposed that the enterprise itself will yield the interest and other debt charges. There are two ways of managing such enterprises. One is by selling the commodity or service produced; the other is by the assessment of a fee upon the users. So far as the debt is concerned there is little difference in these two methods. The former, however, introduces a speculative element, while the latter is more regular in its returns. Sometimes such enterprises fail, and the interest has to be paid out of the revenue from taxation. Not infrequently debts are made of this same kind to render assistance to private companies, and the expectation is that the companies will meet the interest charges. The bulk of local debts the world over are of this general character.

National governments, too, have sometimes contracted debts of this sort. Thus Prussia's debt was *National in-* almost all incurred for the purchase of *vested debts.* railroads, which pay the interest and provide for the sinking fund. Other countries of Europe have similar "invested" debts. The United States has given aid to railroads, but on terms that give no real surety that the debt charges will ever be met by the roads. The wisdom of such loans depends solely on the wisdom of entering upon such enterprises. It may even be wise under certain circumstances to advance money borrowed in this way

to private companies which promise to provide some much-needed facilities, even without any hope that the interest and debt charges will be met in any other way than by taxation. That such debts when contracted should be treated in the same manner as any other debts, and paid as soon as possible, is a matter of good business management. The failure of the assisted private enterprise to make good the sums expended is no reason for the refusal of the government to meet the obligations thus incurred, and refusal under such circumstances is as destructive of credit as would be the failure to meet any other obligation.

The nature of all the remaining forms of debt is clear from their names in the table. A good many of them are merely formal in character and are incurred in carrying out some of the regular processes of business or law. Such debts are never included in the sum total of the burden of debt, because the sums out of which they are to be met are received when the debt is contracted and retained until the debt is due. They are never, except in the case of the grossest mismanagement, a burden on the revenues.

These different forms of debts are all in constant use, and the indebtedness of any nation will show almost all of them. The experience of *A system of* the most advanced nations shows that *public debts.* there is as much need of a systematic arrangement of the different forms of debts as there is of the dif-

ferent forms of taxes. The various kinds of stocks are adapted to the differing needs of the treasury and the tastes of the lenders. The former must be consulted, perforce; the latter, if it is desired to obtain the most favourable terms; hence the scope for the exercise of good judgment on the part of the fiscus in the choice of forms.

CHAPTER III

NEGOTIATION, PAYMENT OF INTEREST, CONVERSION,
AND REDEMPTION OF DEBT

SECTION 1. There are practically two methods for the negotiation of a public loan. One is to prepare the bonds or other evidences of debt for sale, fixing all the conditions and offering them to all comers who will accept those conditions. The other is to determine the amount to be raised, and then to negotiate with bankers or capitalists or other persons in order to ascertain on what terms the sum can be raised. There are, of course, many variations of these plans, but these are the principal ones. In the first case the State loses in a measure the advantage of competition between the lenders. One of the best examples of this method is the so-called "popular subscription." For example, a State decides to issue a certain number of bonds at a fixed rate of interest, selling them to all comers at a stated price. Certain places are designated for the reception of subscriptions. If the terms offered are too low, *i.e.* offer too little advantage to the purchasers, only a part of the loan will be taken up. If they are too high, the State, of course, suffers a loss. In this case

everything depends on the ability of the fiscal officers to gauge the market. This task is comparatively easy if the State already has a large number of stocks outstanding, the market price of which will roughly indicate the possible rate of interest that will be accepted on a public loan. But the extent to which the new loan will probably depress the market will have to be considered.

If the second method be the one chosen, the State lets it be known that bids for a certain sum are desired. The bankers and capitalists, and sometimes the public at large, then compete for the privilege of taking either the whole issue or a part of it. The different bankers offer to provide the whole or a part of the money needed at a certain rate of interest, or if the face of the bonds and the rate of interest have been fixed, offer to buy the stocks at a certain rate, generally quoted as so much per hundred. The most favourable terms offered by reliable bidders are then accepted, and they deliver the money in mass or in instalments to the treasury, in such form as may have been agreed upon, receiving in return the securities, which they are then at liberty to dispose of as they see fit. If the market price rises the gain goes to the capitalists, if it falls they lose. Of course the sums needed often exceed the wealth of any one person or group of persons, and each purchaser has to depend on his ability to dispose of the securities to raise the money to meet his agreement.

In both of these cases various secondary considerations as to the form of the loan, the length of time it has to run, etc., affect the result. Sometimes it has been deemed wise to combine the two methods. That is, to negotiate with the bankers for terms on a part of the debt, and then to offer another part on similar terms to popular subscription, or even to allow of more general competition as to the terms.

SEC. 2. The amount of the interest or the rate is the chief factor in the negotiation of a debt ; but the place and times of payment and the kind of money in which payment will be made are minor considerations of considerable weight. So, also, is the size of the bonds.

Place of payment of interest, and minor considerations.

In the case of popular loans which are intended to be subscribed for by the mass of the people, the bonds must be for small amounts ; in other cases the units are larger. There is no uniformity in this matter. The larger the bonds can be made, the easier it is for the treasury to manage the debt. Of some importance too is the choice between bonds that are payable to the holder, or to certain persons by name, and those payable to persons registered on the books of the State. If the bonds are payable to the holder there is no need of a record of the holders by the government. The government is also spared the trouble and expense of recording changes in ownership. But there is an advantage of greater safety to the holders in the case of the recorded

bonds, which are thus ensured against loss or theft.

It is in general customary to determine the place at which the interest, etc., will be paid. This is frequently some important commercial centre, sometimes the treasury of the State. If in the country issuing the bonds there be in circulation a debased, redundant, or depreciating currency, it is often agreed to pay the interest in some foreign commercial centre, or in foreign money, in order to secure payment in a stable currency. Thus many of the commonwealths of the United States which contracted debts between 1830 and 1850, agreed to pay the interest in London in order to ensure the payment in gold, and to guard their creditors against loss from the depreciated currency then in circulation. When the States appealed to Congress for assistance in the payment of their debts in 1842,¹ this was alleged as a feature involving special hardship. A large part of Russia's debt is payable in Holland and England, and in all of it the kind of money is specified. The same is true of the debts of many other countries.

SEC. 3. While it is often necessary, in order to obtain the required funds on the best terms, to offer many different forms of public securities, yet in a time of absence of press-

¹ See Johnson, *Report on the Relief of the States*, 27th Con., 3d Sess., House, No. 296; a perfect mine of information on the history of public debts in the United States up to 1842.

ure it may become desirable to simplify these forms and to consolidate the debt. This involves the calling in of the outstanding paper and its conversion into another form. Conversion is generally undertaken when a fall in the rate of interest offers the State an opportunity to gain by the process. The reduction of the rate of interest is possible whenever the State enjoys the privilege of repayment. It can then offer the creditor the choice of payment (for which it could obtain the money by the sale of new bonds at the new rate of interest) or of new securities at the lower rate. This mode of conversion or reduction of interest is, of course, perfectly legitimate. The reduction of the rate arbitrarily without the consent of the creditors is as much repudiation as the refusal to pay altogether. It is by numerous conversions and consolidations that the rate of interest on the bulk of the debt of Great Britain has been reduced as low as $2\frac{3}{4}$ per cent.

SEC. 4. The best justification of debt-making is that it distributes the burden of some heavy expenses upon a later period. The cost of this postponement is the payment of the annual interest. In order to fulfil the intention of the loan *Debts must be paid.* and to get rid of the cost of the process *paid.* it is necessary to pay the debt. If these two reasons were not sufficient, the danger of the recurrence of similar extraordinary needs and new appeals to credit, and the eventual danger of bankruptcy, point in the same direction. As we have already

seen, some of the forms of debts contain within themselves the provision for payment. Life and terminable annuities involve the payment of the principal in annual instalments. Other forms call for payment in larger instalments or at a definite termin, for which provision must be made by the collection of funds beforehand. If, however, the expiration of the period finds the debtor State not in the possession of the funds needed, it may have to borrow again to fulfil its agreements. In the case of most perpetual debts it would be obviously unfair to call upon certain holders for the surrender of their bonds and to allow other holders of the same sort of bonds to retain theirs, especially if the rate of redemption is below the market rate. The whole of any issue of bonds, therefore, must be treated as a unit. This involves the gradual accumulation of a fund for the payment of all of the debt of the same kind and issue. There is, however, another alternative. The government may enter the market with this fund, before it is large enough to pay all the debt, and purchase such of its securities as are offered for sale. Care must be exercised in the application of this method not to raise the price of the securities.

The sinking fund. Provision made for the accumulation of a fund for the redemption of the debt is called the sinking fund.¹ The sinking fund

¹ See Ross, "Sinking Funds," *Pub. Amer. Economic Assoc.*, VII., p. 445.

may be defined in two ways; either it is an annual fund, *i.e.* a portion of the annual income, or it is the accumulated capital from this and other sources applicable to the payment of the debt. Not strictly the earliest, but the first important attempt at the arrangement of a regular sinking fund is that of England in 1786 under Pitt. This was a remarkable scheme. It is said to have been suggested by Price, a clergyman, who in 1772 wrote *An Appeal to the Public on the Subject of the National Debt*. His argument was based on the productiveness of compound interest. He urged that a fixed sum, however small, should be set aside every year for the purchase of public stock, and that the interest on the stock thus purchased should continue and should be applied to further purchases. There would then be two sources from which the debt would be cancelled: one, the payment of the annual amount; the other, the ever increasing interest fund. The effect of such a scheme in eventually discharging any debt was regarded as almost magical. It was not perceived that the real efficacy of the scheme lay in the fact that the nation continued to bear the whole burden of the initial interest charge until the debt was paid, and that the real source of payment was the excess of taxation over expenditure. In accord with this idea Pitt appointed a *Pitt's sinking* "Board of Commissioners of the Sink- *fund*.
ing Fund," who were to receive a fixed sum each year, with which to purchase public stocks, at or

below par. Interest on the stocks thus purchased was to be paid to the commissioners, and quarterly applied to new purchases. This much-admired scheme amounted to adding £1,000,000 annually to the taxes needed for other purposes, and continuing the entire burden of taxation until the debt was paid. It is clear that what was really used for debt payment was the surplus revenue. The £1,000,000 was clearly that, and the interest on the stocks purchased therewith need not have been paid but for the sinking fund. There is, indeed, no source from which the debt can be paid but taxation or similar net revenue. So great was the faith of the government in this scheme that it continued the payments to the sinking fund even while borrowing for the war of 1793 and after. The fallacy of Dr. Price's arguments was pointed out by Professor Robert Hamilton of Aberdeen in 1813. Shortly after that, it was estimated that, as a result of the sinking fund system kept up during a period of borrowing, the government had, between 1785 to 1829, borrowed £330,000,000 at 5 per cent to pay a debt of the same size at $4\frac{1}{2}$ per cent. The scheme was then abandoned, never to be resumed. From this time on only genuine surpluses were applied to the payment of the debt. This abandonment of the idea of Price and Pitt, however, had a rather disastrous result, in that it largely suspended debt payment in favour of tax remission. Since 1875 England has tried a new plan. Without commit-

ting herself to a policy which would involve paying debts with one hand and borrowing with the other, and without relying upon mere chance *The new sinking* surpluses, she decided to appropriate *ing fund.* a fixed sum from the consolidated fund for the national debt services, to be continued as long as there were no extraordinary calls upon the funds. £25,000,000 are now annually appropriated for the national debt services, of which, in 1895, £1,718,263 3s. 7d. went into the new sinking fund; whereas in 1875 the sum was fixed at £28,000,000, and a larger amount went into the sinking fund. In addition to this England has been converting her debt into terminable annuities, resulting in a mechanical method of debt payment which may in time of pressure work as the old sinking fund did.

SEC. 5. The American system of debt paying began in 1790 with the application of a surplus from tunnage fees and imports to the purchase *American sys-* of public bonds in order partly to im- *tems of debt* prove the market price of the bonds and *payment.* facilitate conversion. In 1792 the bonds thus purchased were made the basis of a sinking fund, it being determined that the interest on them should continue and be paid to a commission for the further purchase of public bonds. In 1795 the sinking fund commissioners were made the recipients of certain revenues to be applied to the payment of definite portions of the debt. Ross thus summarises this fund: "The sinking fund was now enlarged by

the following additional appropriations: (1) so much of the permanent duties as, with existing income, should enable the commissioners to pay, in 1796 and thereafter, a yearly 2 per cent of the 6 per cent stock; (2) the surplus dividends on the government \$2,000,000 of United States Bank stock after deducting the interest accruing on the remnant of the bank loan; (3) so much of the permanent duties as, with the surplus dividends, should suffice to pay a yearly \$200,000 on the bank loan, till 1802, and then begin the redemption of the deferred stock; (4) the proceeds of the sale of public lands; (5) the proceeds of debts inherited from the old government; (6) all revenue surpluses of any year remaining unappropriated during the next session of Congress.”¹ This fund was not very efficient on account of the excess of expenditures. It served one very important purpose, however, that of regulating the credit of the United States by showing the intention to pay. In 1802 Gallatin organised another plan, which was continued for some time. It was to increase the revenues beyond the current expenditures and apply the surpluses to the debt payment. The results of the two plans have been compared as follows: “The inherited debt and accrued interest amounted in 1791, when funded, to \$76,781,953.14. The Federalists in ten years reduced this to \$72,733,599, but added \$7,193,400 of new stock, mostly at 8 per

¹ “Sinking Funds,” p. 49.

cent, thus bequeathing a burden of \$79,926,999 to their successors. Of this, Gallatin's sinking fund extinguished \$46,022,810 between 1801 and 1811. The purchase of Louisiana, however, added \$11,250,000 to the principal, so that on January 1, 1812, the public debt was \$45,154,189, over thirty-one millions less than the original Revolutionary debt."¹ This comparison is not altogether fair to Hamilton, the author of the older plan, for his fund enabled important conversions to be successfully made which reduced the debt charges. During the War of 1812 the payments to the sinking fund were suspended. After the war the debt stood :

Old debt remaining	\$39,905,183.66
Funded war debt	49,780,322.13
Treasury notes	18,452,800.00
Temporary loans	550,900.00
Total burden on the sinking fund	\$108,689,205.79

The sinking fund was at that time composed of

Interest on stock held by com. . . .	\$1,969,577.64
Receipts from public lands	800,000.00
From duties	5,230,422.36
Sinking fund	\$8,000,000.00 ²

The policy of protection, inaugurated after the War of 1812, separated income from expenditure. The ultimate purpose of most of the taxation, namely protection, was considered so paramount that a high

¹ Ross, p. 67.

² Ross, p. 69, from *Finance*, Vol. II., p. 916.

rate of taxation was continued for that reason. The available surpluses were, therefore, large, and were from time to time applied to the debt. Down to 1824, when all the debt contracted up to that time was practically paid, the sinking fund was managed by a special commission, but since then the secretary of the treasury has had charge of it. The Civil War debt was by the act of February 25, 1862, supposedly placed on a secure basis. “The coin paid for duties on im-
Sinking fund of the Civil War debt. ports was to be applied first to the payment of interest on the bonds and notes of the United States. It was then to be applied ‘to the purchase or payment of 1 per cent of the entire debt . . . to be made within each fiscal year, which is to be set apart as a sinking fund, and the interest of which shall in like manner be applied.’ . . . The residue of customs receipts was to be paid into the treasury.”¹ While no such regularity as was contemplated by this act was realised, yet the debt has been paid from surpluses more rapidly than was anticipated, until the reduction of the revenues in 1895, due to a change in the policy in regard to the protective duties, together with a redundancy in the monetary circulation, which resulted in a foreign drain upon the gold reserves held for the redemption of notes outstanding, made new borrowing necessary.

The commonwealth constitutions of the United

¹ Ross, p. 79.

States very generally charge upon the legislatures the duty of providing a sinking fund. Many of them, besides limiting the amount of debt that may be created, either by naming a fixed sum or a proportion of the revenues that may be used for interest payment, also provide that whenever a debt shall be contracted, a tax shall at the same time be levied sufficiently large to pay the interest charge and provide a sinking fund. The general distrust of the legislatures is emphasised in the constitutions by making such laws irrevocable until the debt is paid. The commonwealths are thus permanently committed to the policy of debt payment, not so much on account of any deep-seated belief in the efficacy of the particular methods laid down, which may necessitate the continuance of debt payment even at a time of borrowing, but on account of the well-founded distrust of the prudence of the legislatures. The same distrust has destroyed the danger of the system, by almost entirely forbidding debt-making by the commonwealths.¹

SEC. 6. In conclusion, it would seem that the experience of great nations shows: that debts must be paid; that they can be paid only by increased taxation; and that the possible weight of taxation

¹ For a full account of the debt policy of the American commonwealths see my monograph, *Das Kreditwesen der Staaten und Städte der Nordamerikanischen Union in seiner historischen Entwicklung*, Jena, 1891.

for this purpose is determined by a consideration (1) of the length of time it is thought desirable that the debt shall run, (2) of the existing burden of taxation, (3) of the general conditions of the people. When the debt has been contracted for some productive purpose it seems fitting that the surplus earnings of such an enterprise should go to debt payment, as this eventually enables a permanent lowering of the cost of such services to the people.

PART IV

FINANCIAL ADMINISTRATION

CHAPTER I

THE BUDGET; ADMINISTRATION OF EXPENDITURE; CONTROL AND AUDIT

SECTION 1. To the fourth and last part of our subject belong the formal arrangements of the public finances, — the preparation and ratification of the budget, the care and preservation of the public funds, the administration and control of expenditures, and the collection of the revenues. It was this side of the subject that first attracted attention and which occupied a large part of the writings of the Cameralists. Lorenz von Stein gives a very considerable portion of his monumental work to these subjects, and the able French writer, Stourm, has devoted to financial legislation a volume entitled *Le Budget*. English and American economists have generally left this field to the jurists and publicists, but Bastable devotes the last three chapters of his book to some of these topics.

In every well-regulated household and every business concern the keeping of accurate accounts, the distribution of the funds among different persons, and the control of expenses have an importance second only to the broader questions of policy. Equally important in the greater housekeeping of the State are the formal arrangements for the enactment of fiscal laws, for the keeping of accounts, and for ensuring compliance with the laws.

The general frame of the fiscal administration, the relation between the various departments, the assignment of particular powers and duties to the different officials or bodies, depends entirely upon the general political organisation. How these features differ from country to country it is the province of Political Science to describe. But the frame of administration has an effect on the finances; and there are certain principles demanded by sound finance, which are followed by every country, no matter what its frame of government. Hence, there is no excuse for omitting this part of the subject.

SEC. 2. Of necessity the methods of accounting and control do not assume a public character until

there is a pretty clearly recognised popular interest in the affairs of the State.

At one time the Roman treasury under the control of the *Censors* and in charge of the *Quæstors* exhibited the features of public economy. But under the Empire the public treasury and the

The importance of correct methods of fiscal administration.

History of fiscal administration.

private treasury of the Cæsars gradually merged into a single one, and the methods of accounting became that of private rather than of civic housekeeping.

The middle ages were essentially unpolitical, and in that period no system of public treasuries proper was developed, except in the free cities. As we have already seen, there were no revenues collected in the monarchies for a distinctly public purpose until the fifteenth and sixteenth centuries, and consequently there could be no public accounts or public control over the funds.

The constant struggle between the representatives of the people and the officers of the older absolute governments for the control of the purse led to the development of distinct methods of accounting and control. The

Conflict develops legislative control.

The most striking feature of the modern systems in European countries is the establishment of the budget, and of the right of the popular representatives to vote taxes and appropriations. In America the right of the legislatures to control the finances was clearly established at a very early date, and little or no advance has been made beyond the crude methods first developed. Most European countries have advanced more rapidly and perfected far better systems. This higher development of the budget in European constitutional governments is explained by the constant conflict between the branches of the government having interests which are theoretically opposed. The modern budget is an outgrowth of

the gradual assumption of power by the legislatures, and the corresponding loss of power by the executives. The latter have had to ask for funds, and the former in granting them have insisted upon knowing what they are to be used for, and upon having assurance that they will not be applied in any other way. In the United States, however, both the federal and the commonwealth legislatures suggest, or initiate, financial legislation as well as grant funds. Both of these functions of initiation and of grant being in the same hands, there is no conflict of interests such as has developed the systems of financial statements and legislative control in Europe. The only care in this country is to see that the funds are not appropriated to private purposes, while in Europe there is the desire to prevent the application of the funds to other public purposes than the ones specified.

SEC. 3. It has been claimed that the English system served as a model for the other European countries. However that may be, and it is true only in part, the English system will serve as a good illustration of the European methods. The fiscal year begins April 1 and ends March 31. Each department of the administration prepares a careful statement, known as the "Estimates," for the coming year. These "Estimates," each of which comprises a good-sized quarto volume, are tediously exact and minute in the statement of what it is expected will be needed

*Europe in
advance of
America.*

*Making up the
English
budget.*

for the forthcoming year. They are called the "Army Estimates," the "Navy Estimates," the "Civil Service Estimates," etc. The *The "Esti-* Chancellor of the Exchequer, in turn, *mates."*

bases his estimate of all that will be needed upon these statements, and calculates the receipts from each source on the basis of the revenues of the previous year. He then presents all the documents to Parliament with a brief, clear statement of what the expenditure will be, what it is expected the revenues will be, what new taxes, if any, are needed, or what taxes may be remitted or changed, in order to make the revenues equal the expenditure. This statement is called the budget. "Usually, but by no means always, the proposals of the Chancellor of the Exchequer are accepted by the Commons, and even when they are not in detail it is seldom that the items of expenditure are objected to. The House is supposed to go through the 'estimates' in detail; it forms itself into a 'Committee of *The "votes."* Supply,' and sanctions every item in the three bulky volumes, but its members have not, as a rule, knowledge enough of the details to offer effective criticism, and the utmost the committee can be said to do, on the average, is to render flagrant abuses impossible. On the average, perhaps that is enough."¹ Parliament cannot directly or indirectly increase the appropriations asked by the ministry in the name of the Crown, nor add new appropriations.

¹ Wilson, *The National Budget*, p. 147.

The estimates both of revenues and expenditure are made with such great care that there is seldom either a surplus or a deficit of any large amount at the end of the year. According to Bastable the estimates of expenditure in England for the three years April 1, 1889, to March 31, 1892, as compared with the results, show an error of only £137,000 in a total of £264,000,000, or a little over 1s. per £100, or \$1 in *Smallness of errors.* \$2000. All credits of disbursing officers expire, and their accounts close, March 31. All appropriations lapse at that time, except those appropriated for the consolidated fund. It requires a special act of Parliament to spend any more money on last year's account even though the original appropriation may not have been exhausted.

In the United States there is no connection between the executive and legislative departments of the government that would allow of any such arrangement as that of the budget in England. The reports of the administrative officers, the President, and the Secretary of the Treasury, are made to Congress and are often accompanied by suggestions of various sorts. But the executive officers have no real access to the ear of the House. Therefore, no *Congressional financiering.* formal budget is presented to Congress. Two separate committees in the House (where finance bills originate, although they may be amended by the Senate) deal regularly with finances; one with taxation, the other with appropriations.

These committees are the "Committee on Ways and Means" and the "Committee on Appropriations." Bills involving expenditure or taxation are regularly referred to these committees. The control of these committees rests solely on convention, there being no constitutional provision for such reference. Even after the committee has presented an appropriation or revenue bill, there is the greatest freedom of amendment, and theoretically any member of the House could, if so inclined, present an entire new set of such bills forming a budget. Appropriations may be increased or decreased, or new ones introduced, without reference to the committees. Practically the control of these committees is very great, especially in the matter of suppressing appropriation bills that may be referred to them for consideration. Certain lines of expenditure may be suggested by other committees, and theoretically may be voted on without reference to these controlling committees. For example, the Navy and War departments may receive appropriations suggested by the committees in charge of them. Many other committees, as, for example, the ones on claims, on invalid pensions, pensions, etc., regularly bring in bills involving expenditure.

Ever since the protective policy was fully established the government has been in the possession of large revenues, which *Revenue laws* *sundered* *from appro-* *priations.* are not determined in any way by the expenditures. So that the consideration of rev-

enue bills has always been complicated by other than fiscal considerations, except during the Civil War. This sundering of the functions of spending and of obtaining revenues, and the general scattering of appropriations, would apparently cause the utmost confusion. But the result is not so bad as might be expected, (1) because of the influence of the committees, (2) because, of course, some attempt is made by the House itself to ascertain whether funds are or will be available for the purposes suggested, (3) because the tax system has not been a variable one, and has yielded, until recently, a pretty regular and gradually increasing revenue, to spend which has often taxed to the utmost the ingenuity of Congress. But the system absolutely prevents any systematic oversight of the finances as a whole, and allows of no measurement of the relative weight of each appropriation. Credits to spending officers do not expire at the end of the fiscal year, July 1, as in England, but generally continue in force until the entire sum is consumed or the object is accomplished. Congress thus loses one advantage for the control of expenditure that Parliament enjoys. The American system, however, has one great advantage over the English in that it allows of a more critical investigation by the legislature of the specific items of each appropriation.

*The fiscal
year.*

The date at which the fiscal year expires is generally set with reference to the convenience of officials in rendering their reports

and to the meetings of the legislatures. The accounts presented are generally for gross income and expenditure, so that the details of the cost of collecting revenues and chance savings of expenditures can be controlled.

There is theoretically no sanction for expenditure of any kind beyond the amount appropriated by the legislature. If any expenditure not so *Deficiency* sanctioned is of pressing necessity, the *bills.* administrative officers may sometimes assume the responsibility and make the appropriation, subject to the ratification of the legislature when it next meets. This discretionary power is exercised to a very limited extent in most countries. In the United States, however, the disorder attendant upon the appropriations involves the annual presentation of a "deficiency bill." When any action involving expenditure has been sanctioned by the legislature, and insufficient funds have been appropriated, there is a moral obligation resting on the legislature to make the requisite appropriation afterward.

SEC. 4. When the budget has been prepared and voted, the next step is to see that the expenditure is carried out as authorised and to prevent any misappropriation of the funds. In England *English con-* the funds are deposited with the Bank of *trol and audit.* England, subject to the order of the Comptroller and Auditor General only. This officer's duties are a combination of those of the old Board of Audit created by Pitt in 1785 with those of the Ex-

chequer, and date from 1866. No payment is made without (1) an Act of Parliament, (2) a requisition by the Treasury¹ issued to the Comptroller General, (3) a grant of credit for the amount authorised by the Act good for one year, (4) a Treasury order directing the transfer of the money to the Paymaster General of the Service.² As the estimates have been closely scrutinised, there is little opportunity for the misapplication of funds. There is none whatever for over-draft. Again, after the expenditure has been made, the accounts with vouchers are passed through the Comptroller's office for his approval, or audit. The report of that officer is subjected to the final revision of the Parliamentary Committee of Public Accounts. Thus the whole process begins and ends with Parliament. It will be seen that there are really two parts to the process. First, the control over the "issues" to the disbursing officers, that is, over the placing of the public moneys in their hands. Secondly, the audit of the accounts after the expenditures have been made.

SEC. 5. In the United States,³ the direct control of the money is in the hands of the executive officers, subject to the orders of Congress. The safeguards consist in making the processes of ex-

¹ See Wilson, *The State*, pp. 696-698.

² Cf. Bastable, p. 705.

³ See Renick and Thompson, *Political Science Quarterly*, VI., 248-281, and VII., 468-482.

penditure complicated and subjecting each item to the scrutiny of several sets of executive officers. The idea of the original plan in the *Original plan of control and audit in the United States* was not to allow of issues to the regular disbursing officers, but to control expenditure by a careful scrutiny of the accounts or claims rendered. The Treasury was to be reached only after the claims had been cut down to the lowest possible figure. Claims against the government were first passed upon by an auditor, then by a comptroller, either of whom might reject them. Then the Secretary drew a warrant upon the Treasurer, and that warrant was recorded by the Register and countersigned by the Comptroller. Hamilton found it necessary, for the sake of economy, to pay cash for many things needed by the government, and hence this original plan broke down. Issues were made to disbursing officers, and the necessary warrants were drawn for each particular item of expenditure, afterward, in order to legalise the transaction.

For many years the United States had a very complicated system of audit, control, and record. There were six Auditors, so called, and the "Commissioner of the General Land Office," who was Auditor for the lands *The recently abandoned plan.* account. Then there were three Comptrollers, known as the First and Second Comptrollers, and the Commissioner of the Customs. Lastly there was the Register. All of these were assisted by a large body

of clerks. These offices were organised into four co-ordinate branches, with separate jurisdiction. Accounts were first examined and passed upon by an Auditor, then re-examined by a Comptroller. Claims disallowed by these officers could be pushed in the Court of Claims and appealed from there to the Supreme Court. The assignment of accounts to the different Auditors and Comptrollers was almost arbitrary and with little system. The First Auditor looked over the general income and expense accounts of the Treasury, the special accounts of the customs receipts, the expenditures for the legislative and executive departments, special accounts of the Treasury department, — as of the interstate commerce commission, of the public debt, of engraving and printing, of the coast and geodetic survey, of the life-saving service, of the lighthouse establishment, of the public buildings, of the government of territories, of the District of Columbia, of the central administrative departments of War, Navy, the Interior, etc., of the departments of Labour and of Agriculture, and all the expenditure for the Judiciary. The Second Auditor had the accounts from the Indian Service and the Army. The Third Auditor had the pension account. The Fourth had the accounts of the Navy. The Fifth looked over the accounts of the Collector of the Internal Revenues. The Sixth was for the postal accounts. The First Comptroller then revised the accounts that were assigned to the First and Fifth Audi-

tors, except the Customs account, for which the Commissioner of the Customs was Comptroller, and those of the Commissioner of the General Land Office. The Second Comptroller had the accounts of the Second, Third, and Fourth Auditors.

All of this has recently been changed. "The act of July 31, 1894, making appropriations for the legislative, executive, and judicial ex-
penses of the Government for the fiscal year ending June 30, 1895, altered the
The present plan of audit and control.
accounting offices of the Treasury and changed materially the system of accounting. The detail revision of accounts here to fore made by the First Comptroller, as well as by the Second Comptroller and the Commissioner of Customs, is abolished, as are the offices of the Second Comptroller and the Commissioner of Customs, the First Comptroller being made the sole Comptroller of the Treasury. A revision of accounts under the new system will only be made when either the head of a Department or the claimant is dissatisfied with the settlement of an account by an Auditor, or when the Comptroller himself has reason to believe that any particular account ought to be subjected to a second revision. Much labour will be saved by this system, and the adjustment of accounts ought to be greatly expedited. It is believed this will be accomplished without danger of mistake or loss to the government. It is one of the duties of the First Comptroller to countersign all warrants drawn by the Secretary of the Treasury

which shall be warranted by law.' This duty will continue with the Comptroller of the Treasury under the new system. As the Secretary of the Treasury has the duty devolved upon him of originating warrants, and as all such warrants must be countersigned by the Comptroller, no warrant finally becomes effective without their concurrent action."¹

There are now six Auditors: (1) for the Treasury Department, (2) for the War, (3) for the Interior, (4) for the Navy, (5) for the State, etc., (6) for the Post Office. The accounts are still distributed in the old arbitrary unsystematic fashion among the different Auditors according to the illogical scheme by which the different duties are divided among the Departments.² It is hard to see how this can be bettered until the work of the Departments is rearranged. The recent change is a great gain in the direction of simplicity and speed. The Auditor's work stands unless appealed to the Comptroller, and is no longer necessarily gone over again by a comptroller.

The Register keeps ledger accounts with all appropriations made by Congress, and also keeps all *The Register's* the personal disbursement and receipt *office.* accounts pertaining to the customs, internal revenue, diplomatic, treasury, judiciary, interior, civil services, and the public debt. General receipt and expenditure ledgers have been kept

¹ *Finance Report*, 1894, pp. 836, 837.

² See Wilson, *The State*, pp. 567-570.

running from the foundation of the government. The Register furnishes to the proper accounting officers copies of all warrants covering proceeds of government property, where the same may be necessary in the settlement of accounts in their respective offices. He also furnishes certificates of balances, advances, and repayments to the offices of the First and Fifth Auditors, for settlements of accounts, and certifies to the First Comptroller, on requisitions for advances, the net indebtedness of disbursing agents as shown by the ledgers.¹ The Treasury Department itself exercises a pretty extensive supervision over expenditures.

¹ *Finance Report*, 1894, p. 737.

CHAPTER II

COLLECTION OF THE REVENUES, CUSTODY OF THE FUNDS, AND THE PUBLIC ACCOUNTS

SECTION 1. Under the early methods of collecting revenues, the tribute due, the economic receipts, and the voluntary contributions were delivered directly to the chief or leader. Many of the early direct taxes were similarly treated. Indirect taxes upon commodities and transactions could not be managed in this way. The first crude method of dealing with these taxes was that of the tax-farmer, the Roman Publican. He purchased for a price the privilege of collecting all of certain kinds of taxes that he could obtain. The same method was extended to other taxes where there was no similar necessity for it. This farming of taxes was used through the imperial era of ancient Rome, and copied by France it was extended into modern times. The various direct contributions of the middle ages which were apportioned among the different cities, or "estates," were frequently delivered directly to the Prince or his Treasurer. All of these crude methods were abandoned as soon as there was a distinct recognition of the authority of the taxing power over all

*Early methods
of collecting
revenues.*

the different parts of the country and over each contributor individually. The apportionment system, as originally used, was a more or less distinct recognition of the autonomy, and possibly of the partial political independence, of the tax-payers, be they provinces, cities, or classes of individuals.

SEC. 2. The collection of the taxes is usually the duty of the regular fiscal officers of the general administration, but industrial and commercial receipts are frequently collected by special boards in charge of them, who turn the money over to the Treasury. Assessment and collection are so closely connected that they can be studied together. In the collection of customs duties there are two things for the officials to care for. (1) They must look out for the arrival of all the taxable commodities and prevent smuggling. *Collection of customs duties.* (2) They must ascertain the value of the goods if the taxes are *ad valorem*, and the number of pieces if specific. The invoices, supported by the usual certificates, oaths, etc., are of the nature of a declaration by the owner, or importer. They are then subjected to the scrutiny of official appraisers, whose knowledge of the nature and value of the goods is very accurate. The tax is then paid to the collector at the place of importation or when it reaches the recipient in the interior, but before it is delivered to him. In case the goods are to be admitted into the interior of the country, or of the customs district, before the tax is paid, as is the

case when the person to whom the goods are sent resides in the interior, the package is sealed up, or "bonded," and the seals can only be broken by an authorised collector after the payment of the tax. In countries where there are no general tax collectors in the interior, this method is not feasible, and the goods are held in the custom-house on the boundary until the tax is paid. With a few exceptions this is the practice of the United States. But in Germany, where there are regular fiscal officers of the central government in almost every hamlet, goods are regularly shipped to the consignee, and the tax paid in the interior.

In the case of excises, the factories, breweries, fields, and other places where the taxed goods are produced are subject to regular inspections and are more or less under the constant supervision of the officials. The tax is collected directly from the producer or by the sale of stamps and licenses.

SEC. 3. In the case of direct taxes it is the assessment that is the most difficult part of the process.

Assessment of direct taxes. The methods of assessing some of the taxes have already been suggested. The work consists of two parts. (1) It is necessary to ascertain the base — the persons, the property, or the revenues subject to taxation. (2) It is then necessary to fix upon the valuation, or the rating of the base in each particular case. The latter part of the process is "making the assessment." In this the

contributor may be called upon to assist, or the officers of the government may proceed entirely alone. Generally a declaration is requested, or may be required, from the tax-payer, and the officials then investigate the truth of that declaration. In Europe it is customary to form assessment commissions consisting of representatives of the tax-payers in the district, who are acquainted with the local conditions and act with the officers of the government. These commissions help the regular officers of the fiscus to make the assessment, or sit as a sort of court to hear appeals from the assessment made, or both. The final assessment, however, is made by the fiscal officers.

In the American commonwealths, the assessment of the general property tax is usually made by a board of locally elected assessors or an assessor. The assessor calls for declarations from the different contributors.

*Assessment of
the general
property tax.*

The law in most States imposes severe penalties for failure to comply with the requirement of declaration, or for false declaration. But, nevertheless, there is, for the most part (Pennsylvania is almost the only exception), the utmost laxity in enforcing the law concerning declarations. Only the unusually conscientious, who voluntarily come forward with complete statements, are reached in this way. So general is the habit of neglecting this duty that it is practically impossible for the assessor, no matter how anxious he may be to have the law complied

with, to prosecute all the persons whom he knows are evading assessment. The general practice is to default the declaration and allow the assessor to find out if he can what taxable property the contributor has. If this were done by only a few persons they could easily be brought to terms under the existing laws, but when nine-tenths of the population refuse to comply, the assessor is helpless, and the only effect that follows from the declaration by the few is to make the existing inequalities of the general property tax worse than ever. Real estate and other visible property is easily assessed. The officer has at his command the records of titles, of deeds, etc., which he can investigate, and he ascertains the value of each piece from his own personal observation of prevailing prices. As we have seen, personal, intangible property escapes almost entirely. It would seem that this difficulty of administration is insuperable. No merely severe methods of assessment will ever cure the evil.

Above the assessor in the United States there are generally two boards of equalisation, though sometimes only one. The first board is local, covering the same district as the assessor. This hears appeal from the tax-payers in regard to their assessment. It equalises between individuals. The second board is for the whole commonwealth, and is known as the State Board of Equalisation. These boards are to adjust the burden of State

taxation equally between the different districts. As has already been explained, a local assessor may make the assessment in his district lower than that in the other districts. This will not affect the burden of local taxation, for all that is needed is to raise the rate. But it lessens, if the assessment stands, the burden which the State taxes impose. These central boards are of two kinds: (1) those with power to add to or subtract from the assessment of each district, but in such a way as not to change the total amount; (2) those with power to change the assessment, even of the individuals, and which may and generally do change the total assessment of the State. As these boards seldom have sufficient powers, and never sufficient information as to the local conditions, the effect of their action is not all that could be desired. The only possible solution of this difficulty is the separation of local taxation from that of the commonwealths, so that the assessment can be made independently for each.

SEC. 4. After the assessment has been completed, it is comparatively easy to make the collection. All that is needed is a collecting agent of the treasury conveniently located, to whom the tax-payers may go, or a collector who goes to the tax-payers. The burden of taxation may be seriously increased if the convenience of the tax-payers is not consulted in this matter. The size of the district over which a col-

*Convenience
of the contrib-
utor to be con-
sulted in
collection.*

lector has supervision will depend upon the density of the population. If the collector is to be sought out by the contributors, it is best that his office should be located in some business centre frequently visited by the contributors. According to the principle of "certainty and convenience," the taxes assessed upon the same person should all be entered in a single bill and all be payable to the same collector. The tax-payer should be informed as early as possible of the total amount of taxes that he has to pay, of the number of instalments in which they are payable, and of the conditions of delinquency and its penalty. Some of the American commonwealths disregard this rule entirely. They add grievously to the burden of taxation, especially in the country districts, where they are already entirely out of proportion to the ability of the people, and increase the irritation felt by the contributors, by inconvenient location of the collectors' office, and by requiring the payment of State and county taxes to one set of collectors, while the town and other municipal taxes are paid to a different set and upon separate bills. The most economical and least irritating process is to have all the taxes collected by the same person.¹

SEC. 5. The transfer of the public funds from one

¹ The writer knows of an instance where a farmer has to travel fifty miles to pay his State and county taxes, while the local taxes are collected within two miles of his home. This is not an extreme case.

part of the country to another is, in modern times, attended with little risk. It is most conveniently done by means of the banks or the post office. If the country is sparsely populated and insecure, the collector's office should be at or near the bank or vault in which the money is to be stored. In large countries, as, for example, the United States, it is convenient to have a number of branch treasuries scattered about the country, at which collections can be made, and through which money for expenditure can be distributed to the disbursing officers.¹

The storage or safe-keeping of the funds is accomplished in one of three ways. (1) As in England, a great State Bank is made custodian of the funds which are sent to it from the various collectors who deposit with its branches. (2) As in France and the United States, the treasury and the sub-treasuries are the chief custodians of the funds.² (3) As in the commonwealths of the United States, where (except in Indiana, Ohio, California, Kansas, Mississippi, Nevada, and Texas) private or other banks are made the depositories of the public moneys. When protected by proper safeguards, such as the giving of personal bonds and

¹ Sub-treasuries are at Baltimore, Boston, Chicago, Cincinnati, New Orleans, New York, Philadelphia, St. Louis, and San Francisco.

² According to law, the Treasurer and disbursing officers of the United States may make deposits in the National Banks. About \$14,000,000 are regularly so deposited.

collateral, the bank depository system has proved itself far safer and more economical than the independent treasury, which is only to be defended on political grounds, if at all. The experience of the United States federal government in the early days with "pet banks" points to the political difficulties of the bank depository system. The bank deposit system prevents the periodic disturbance of the circulation by the withdrawal or storage of money. If the independent treasury system were used by all the departments of the government, this disturbance would undoubtedly be serious enough to affect prices.¹

SEC. 6. The mere mechanical details of the methods of bookkeeping and public accounts cannot be described here. About all that can be done is to make such explanation as will enable the student to easily comprehend the published accounts and statistics in their main features.

The revenue account is generally very simple. It contains items named according to the sources from which they come. Care must be taken in studying the reports of the fiscal officers on the revenues to distinguish the receipts that represent income from the receipts that are merely formal transfers and bookkeeping expedients. For example, the English finance account of

*Public
accounts,
English.*

¹ Cf. Kinley's "Independent Treasury," and Buckley's "Custody of State Funds," *Annals of the American Academy*, Vol. VI., 3, November, 1895.

the United Kingdom for the year ending March 31, 1895, contains the following: Receipts; I. Balance in Exchequer, April 1, 1894, £5,977,118, 18s. 9d. II. Revenues received into the Exchequer; viz., Customs, Excises, etc., £94,683,762, 10s. 2d.; total, £100,660,881, 8s. 11d. This was what England had to draw on. But following that appear a number of other "Exchequer receipts," among which are repayments of Advances, as, (1) by the mint for the purchase of bullion for coinage, £700,000, representing merely a return to the Exchequer of money temporarily passed to the mint. The same year the Exchequer advanced to the mint £615,000, which will appear in 1896 as a receipt increased by the seigniorage. (2) The Exchequer borrows money temporarily in anticipation of the revenues. This appears, of course, as a receipt of £13,700,000, but is not revenue. (3) It renewed a number of outstanding bills and bonds amounting to £14,123,400. These appear as receipts, offset, of course, by an equal expenditure. But (4) it created an additional debt of £760,000, for barracks and telegraph. This sum may fairly be called revenue. So that the total amount of money that came as actual income to the treasury was £101,420,881, 8s. 11d. But the total receipts foot up £130,217,647, 13s. 8d.

On the expenditure side, the Issues, or credits to disbursing officials, are first the Consolidated Fund "Services." That is, the payments for (1) the National Debt "Services," (2) the "other consoli-

dated fund services," which consist of the civil list, annuities and pensions, salaries and allowances, courts of justice, miscellaneous "services," the Exchequer contributions to Ireland, and the annuity under the Indian Army Pension Deficiency act of 1885. After the consolidated fund "services," which foot up to £26,500,000, come the supply "services" for the army, ordinance factories, navy, and miscellaneous civil "services," for the collection of customs and inland revenue, post office, telegraph, and postal packet "services." These two items, the consolidated fund and supply "services," contain all that is strictly chargeable to the revenue. They amounted in 1895 to £93,918,420, 18s. 4d. In addition there were special expenditures of £810,000, making a total of £94,728,420, 18s. 4d. But there were a large number of additional issues: (1) bills and bonds paid off by receipts from new bills, (2) temporary advances repaid, a part of which were for deficiencies in the consolidated fund. These and one or two other minor items, with a balance of £6,300,826, 15s. 4d., brought the "Issues" up to the receipts.

In studying the accounts published by the Treasury Department of the United States, we have different difficulties to meet. There is generally a clear statement, free from repetitions, or transfers, of the revenues according to the sources, and of expenditures according to departments, or objects. The only

*Public
accounts,
United States.*

difficulties arise from the peculiar and arbitrary grouping of the expenditures. This comes from the illogical distribution of duties among the different departments already referred to. Some of the peculiarities are that the expenditure for the "civil establishment" includes foreign intercourse, public buildings, collecting the revenues, deficiency in postal revenues, rebate of tax on tobacco, refunding of direct taxes, French spoliation claims, District of Columbia, and similarly incongruous items. Those for the military establishment included rivers and harbours, forts, arsenals, and sea-coast defences. For the naval establishment included construction of new vessels, machinery, armament, equipment, and improvement of navy yards. Expenses not otherwise classified are generally listed as expenses of the Treasury Department.

SEC. 7. An interesting phase of public bookkeeping is the separation of accounts into funds. When Parliament voted a tax it was formerly *The "funds."* for a definite purpose, and the plan was to reserve the whole of it for the proposed purpose. But the receipts and expenditures of these funds never exactly balanced, and simplicity finally required that all should be turned into the consolidated fund. This method of bookkeeping is best exhibited to-day by the accounts of the commonwealths in the United States, although also used in national and municipal accounts to some extent. All the receipts are distributed among various so-called "funds,"

or accounts, according to some prearranged plan. A separate account is kept of all receipts and expenditures belonging to each fund. With the exception of a few trust funds arranged to keep certain sums inviolate, these funds are, in effect, mere bookkeeping contrivances. With the exception of the General Fund, which receives all the money not otherwise appropriated to special funds, each of these accounts generally bears the name of the expenditure met thereby, sometimes of the revenues supplying them. In some commonwealths the number of these funds is very large.¹ The accounts are sometimes complicated by transfers from one fund to another, in which case they appear twice in the account, and frequently swell the apparent receipts enormously.

Local budgets are necessarily determined by the frame of local government and the number of functions performed by each. Thus in Eng-
Local tions performed by each. Thus in Eng-
accounts. land the public function to be performed constitutes the basis of local organisation, and until the recent reforms each local governing body had only one or two duties ; hence only one or two general accounts of expenditures, and one or two sources of income. But in America each local governing body generally has charge of all the local functions affecting a certain area, and may have as many expenditures and revenues as a com-

monwealth, or even more. Here methods of accounting defy classification and frequently defy sensible interpretation, even by the officials in charge. There is a crying need for reform here in the direction of uniformity.¹

¹ See in this connection a form suggested for published reports of municipalities by Prof. H. B. Gardner, in the *Pub. of the Amer. Statistical Assoc.*, June, 1889, and adopted, in part, by the Eleventh Census of the United States, as the basis of schedules and inquiries sent to the municipalities.

CHAPTER III

FINANCIAL ADMINISTRATION OF WAR; ILLUSTRATED BY THE EXPERIENCE OF THE UNITED STATES IN THE WAR WITH SPAIN

SECTION 1. A serious war usually imposes a sudden, new burden upon the treasury, the exact, or even the approximate, size of which it is not possible to estimate at the outset. Many of “*Extra-ordinary*” the expenses of war belong to that class “*expenses*.” which financiers call “extra-ordinary” to distinguish them from the usual or current expenses of the government. The amount by which the ordinary expenses are increased in time of war depends upon many circumstances. Obviously, the chief factor is the size of the forces engaged and the duration of the struggle. Naturally, the chastisement of a few dozen hostile Indian braves in the immediate vicinity of the regular army posts involves practically no “extra-ordinary” expenses. Allowance is usually made in the ordinary budget for the expenses a war of that kind would occasion. But many circumstances less obvious than the size of the forces engaged enter into the determination of the amount of the “extra-ordinary” expenditures. Thus, for example, a naval war, unless it happens to

become the occasion for the purchase of new ships, involves comparatively little addition to the ordinary expenses of maintaining the navy. A country which has a large standing army incurs relatively less "extra-ordinary" expense when engaging in war than a country which, like the United States, has only a small regular army.

The ordinary expenses being provided for by the regular budget, the financier's chief concern in time of war is the provision of the "extra-ordinary" funds. If the operations of the war are likely to interfere with the ordinary revenues, he must furthermore be prepared to treat a part of the ordinary expenses as "extra-ordinary," at least to the extent of furnishing new means to meet them. It is not often possible, and still less often expedient, to curtail the ordinary expenditures in any way for the purpose of saving money to meet the new expenses. How *The problem* to increase the receipts of the treasury by *presented* an amount sufficient to insure the efficient *by war.* conduct of the war, without too serious disturbance of the industries and commerce of the people, upon which all the revenues depend, is the problem for the finance minister to solve. The "extra-ordinary" demands come thick and fast, especially at the beginning of the war, and they must be met, and met at once. The amount which may be needed at any given time is not ascertainable. But in spite of that, sufficient funds must always be on hand. Upon this more than upon any other one thing

depends the fate of war. The war financier can never plead that he has no funds, nor can he ask for time in which to collect. He must have the money when it is wanted and in the amounts required. No degree of skill on the part of officers, or bravery on the part of the men, no degree of self-sacrifice at the front, can compensate for failure on the part of the financier to provide the ways and means. His powers are, therefore, of the greatest and most unusual.

SEC. 2. Possibly the most natural source to turn to in time of war for the increased revenues needed is the existing system of taxes. At first
Increased rates for old taxes. thought it might seem proper to attempt to obtain new income by raising the rates of the old taxes. To some extent this is possible. In every well-arranged tax-system there should be some taxes which can be made to yield an increased revenue by simply raising the rates. One of the chief reasons for the establishment and the retention of the British "property and income tax," for example, is found in the elasticity of the returns. But not all taxes can be treated in this way. Sometimes an increase in the rate of taxation will disturb industry and commerce and do a greater injury to the welfare of the people than is received from the damages of war. Again, an increase in the rates of certain taxes will diminish the revenue or even destroy it entirely. In not a few taxes the only way to increase the revenue is to lower the rates. This

is the case with most protective duties. Any change in the rate of such taxes is bound to affect industry and commerce, and to affect them unfavourably in the first instance, whatever the subsequent effect may be. A war brings perplexities enough to business without the creation of artificial ones, and the financier should not interfere with these taxes. It added not a little to the perplexities and dangers of the Civil War in the United States that the industry and commerce of the people were repeatedly disturbed during the war by changes in the tariff as well as by the military and naval operations themselves. There are, therefore, but a limited number of old taxes from which any aid can be sought. In the United States, owing to the one-sided system of federal taxation, the number of them is very small indeed. The American financier must look elsewhere for his new revenues.

SEC. 3. The next resource, naturally, is new taxes. But the establishment of new taxes, or even the restoration of old taxes not in use at the time of the war, is a matter requiring *New taxes.* considerable time. Even if it were an easy matter to decide upon the best form of taxation and to get the necessary authority from the legislative branch of the government, the organization of the new administrative forces for the collection of the taxes is a matter requiring time. No new system of taxation reaches its normal revenue-yielding powers within many months of its enactment. If the taxes are

entirely new, the time required is longer. But even if they are more or less familiar to the people from use on some previous occasion, a considerable lapse of time must intervene between the beginning of war and the receipt of sufficient new revenues to meet any considerable part of its expenses. Furthermore, the expenses of war are now so enormous that any system of taxation which raised, or attempted to raise, the entire amount needed during the probable duration of the war would be so burdensome as to crush the people. It is therefore extremely unwise, and practically impossible, to attempt to raise the entire cost of the war by immediate taxation. The only other resource is borrowing.

SEC. 4. The use of the public credit, in time of war, is attended by many special difficulties. The outcome of war is always more or less uncertain. Even if defeat would not entirely cripple the nation's resources and render the repayment of the loan uncertain, or affect the payment of interest, yet there are many considerations which make the lender hesitate. The fact that the duration of the war, the extent to which other nations may become involved, and many similar considerations affecting the size of the total demand upon the public credit are unknown, vastly increases the difficulty of placing a loan on favourable terms. But on that very account it is particularly necessary for the successful administration of the war that everything should be done to strengthen

*The use of
credit, in
time of war.*

and preserve the nation's credit. There may come a time in the progress of the war when the only source from which any funds can be had is the money market. If, therefore, the financier has done anything to weaken the nation's credit at the beginning of the war, he is apt to be helpless at the close. Credit tends to weaken as debt increases.

It is for this reason that resort is frequently had in early war-borrowings to the simplest and most primitive method of debt-making; *Provision of revenues to preserve public credit.* namely, that which provides revenues for the payment of the interest and the repayment of the principal at the very time the debt is contracted. The creditor sees in the new funds flowing into the treasury the security for his advances, and the guarantee of good faith on the part of the government. So long as every new loan is accompanied by new taxes from which its cost can be met, the public credit is practically secure. But if, on the other hand, the government neglect this precaution during the first stages of the war, any attempt to resort to it at a later stage is apt to be regarded as the desperate device of unsound financial management and the presage of coming bankruptcy.

Public credit is a plant of slow growth and extremely tender. It withers in a day before a breath of doubt.

Inasmuch as a successful outcome cannot be hoped for in modern warfare without the funds obtainable solely by public borrowing, and the necessity for

loans increases the longer the war continues, it behooves the modern war financier to guard the nation's credit as his most precious treasure. No sacrifice is too great which will strengthen it and preserve it intact for the later stages of the war.

SEC. 5. Such, stated in condensed form, are the general principles which should guide the *fiscus* in time of war. No better illustration of the application of these principles can be found in history than is afforded by the operation of the United States Treasury during the recent war with Spain; and by following in some details the story of that war, we can obtain a clearer view of the principles themselves.

The situation, as it confronted Secretary Gage when the news of the destruction of the *Maine* reached Washington, may be summarized

The situation of the United States Treasury at the outbreak of the war.

somewhat as follows: The Treasury had a balance on hand of about \$225,000,000.

But, as we shall see below, only about \$25,000,000 of this was really available for immediate use in the prosecution of the war. The ordinary expenditures of the government, outside of those for the postal system, which is nearly self-supporting, amounted in round numbers to \$350,000,000 per annum. For the first time in many months these expenses were being nearly met by the revenues. Indeed, it was estimated that at the ordinary rate of expenditures there might be a slight surplus at the end of the year. The tariff

was expected to yield about \$200,000,000, the internal revenue taxes about \$165,000,000, and there were about \$25,000,000 to be expected from miscellaneous sources.

SEC. 6. The larger part of the income, however, came from taxes which could not well be tampered with. The tariff had been so long a subject of controversy that there was little desire to alter its recent settlement. For reasons *The tariff could not be changed.* already made clear, there were many parts of the tariff which could not well be changed. Except in a very few instances, the income to be obtained from it would not be increased by raising the rates. In the great majority of instances to raise the rates would have been to lessen the receipts, while to lower those rates for the purpose of increasing the income by allowing larger importations would have been to remove the protection afforded by them. This was contrary to the avowed policy of the administration. It would, moreover, have served to disturb industry and to perplex its leaders at a time already sufficiently disquieting, and might have proved but an aggravation of the disturbance caused by the war. The great body of the customs rates, of which there are thousands on the tariff schedules, are not productive of much revenue and are not intended to be. They are there to restrict importations. These certainly could not well be changed. Of the bare dozen or so of articles of importation which do yield a reve-

nue, sugar, one of the most important, was likely to be interfered with by the war. At the existing rates, sugar imported should yield a revenue of about \$80,000,000 a year, but at least half of the importation was jeopardised by the war itself, and it would have been highly impolitic to have changed the rate at this time. Iron, which was once a source of considerable revenue, was, in consequence of the changes which have taken place in that industry, and of the protective features of the customs law, not available to provide new revenues, as the importations are at best small. Cotton goods, the tax upon which yields considerable revenue, were protected; so were manufactures of hemp, flax, and jute, of leather and of wool. Drugs, medicines, and chemicals were already taxed up to the limit of productiveness, from a revenue point of view. In short, there were but four important articles imported which might be used to yield additional revenue. These were hides and skins, raw silk, tea and coffee. To tax hides and skins or raw silk would, probably, under the prevailing theory of "compensatory" duties, have involved an increase in the rates on the products manufactured from them, to maintain the same degree of protection that those products now enjoy. That would have reopened the whole tariff controversy, and have rendered the outcome of the war revenue measure extremely doubtful. Clearly it were wisest, considering how recently the tariff issue had been tem-

porarily settled, to leave them alone. As a matter of fact, then, there are only two articles in the whole list of importations which might be considered by the Secretary of the Treasury in his search for new income. These were tea and coffee, which might, perhaps, have been made to yield together nearly \$80,000,000 additional revenue. That was approximately all that could be expected from the tariff.

In the war revenue bill, as presented to the House of Representatives by the Committee on Ways and Means, of which Mr. Dingley was chair- *The tax on tea.* man, there was no suggestion of using the tariff in any way for obtaining additional revenue. It was not until the very end of the long discussion of the measure in the Senate that it was proposed to put a duty of ten cents a pound on tea. That measure passed the Senate and was accepted by the conference between the two Houses and by the House of Representatives without any public discussion as to its merits. The reason for this duty, as for the omission of coffee from the list, is therefore not clear. The tax on tea is an important matter. The yield will be over \$10,000,000 per annum. A similar tax on coffee, which would have been at the rate of 8.5 cents per pound, would have yielded about \$70,000,000 more. It is, therefore, somewhat surprising that it should have attracted so little attention from the members of Congress.

SEC. 7. Since the revenue from the tariff was not to be increased, the only resource available was in-

ternal taxes. That these internal taxes should have taken the same general form as the taxes used dur-

The main resource was internal taxation. ing the Civil War, and consequently more or less familiar to people and officers, was but natural. Under the stress of war

it is unwise to attempt to organise entirely new taxes, such, for example, as an income tax. Though an income tax had been used during the Civil War, that form of taxation was under the shadow of an adverse decision from the Supreme Court. Even if an income tax law which would have been constitutional, according to the recent decision of the court, could have been drawn, it is doubtful whether it could have been made productive within any reasonable period of time. Recourse might have been

An income tax and direct taxes not available. had to direct taxes, apportioned among the States according to population. These taxes could then have been raised in any manner which the State authorities chose.

But there are two fatal objections to this plan. The apportionment of taxes according to population is fundamentally unjust and unequal. What it amounts to practically is a graduated poll-tax. The different commonwealths vary so in wealth *per capita* that any *per capita* tax, however raised, would be unfair. Although the census estimate of wealth in 1890 was anything but satisfactory, yet the method used in that estimate was uniform throughout the country; and such differences as that between South Carolina, with about \$350 *per capita*, and Nevada,

with \$4,000 *per capita*, show how utterly inadequate the constitutional method of raising direct taxes has become. Then, again, the method of taxation by which most of the States raise their revenues, and which they would probably follow in raising their share of any apportioned taxes, is the worst in use in any civilised country, and the injustice of the apportionment would have been enormously increased by the injustice in collection. The second objection to this method of raising direct taxes prescribed by the constitution is that it takes an inordinate length of time, and war taxes should begin to yield a revenue as early as possible.

The only available plan was, therefore, to seek additional revenue from the existing, indirect, internal taxes, the excises or, as they are called in the United States, the “internal revenue” taxes, and to supplement these still further by new taxes of the same sort. Briefly summarised the revenue bill nearly doubled the existing rate of taxation upon beer and other similar fermented liquors ; it imposed special taxes on bankers, brokers, pawnbrokers, theatres, circuses and other shows, bowling-alleys and billiard rooms ; it raised the rates on tobacco of all kinds ; and it placed stamp taxes on stocks and bonds, commercial papers, legal documents, checks and drafts, proprietary medicines, toilet articles, bills of lading, insurance policies, and a number of other things. Special direct taxes were imposed on the oil-trust and the sugar-trust,

*Description
of the new
taxes.*

and on legacies and distributive shares of personal property.

SEC. 8. As the war revenue bill passed the House its probable yield was variously estimated at from *Yield of* \$90,000,000 to \$105,000,000 per annum, *new taxes.* the former being the better estimate. As amended in the Senate and finally adopted, it promised to yield at least \$150,000,000 per annum. The actual yield in addition to the regular revenue during the first month was about \$13,000,000.¹ But the expenses of war during the first few months, if not for a long time after that, would be, it was estimated, at least double that sum and possibly more. Therefore, unless the Treasury had a considerable balance on hand, there would have been no possibility of conducting the war at all without immediate loans. The balance in the Treasury at the outbreak of the war was \$225,000,000. Upon *The funds* this were a number of claims, some of *available.* which, however, were not immediate. \$100,000,000, known as the gold reserve, had to be held for the preservation of the parity of all parts of the circulation and the avoidance of general financial

¹ It is not possible and probably never will be possible to state exactly how much the new taxes have increased the revenues. In the first place, the reports do not segregate the income obtained from the new taxes, from that obtained from the old; and in the second place, the changes in the rates, and the existence of new taxes have changed the yield of the older parts of the system by an amount which cannot even be estimated. The total increase in the revenues for the fiscal year 1899 over 1898 was about \$115,000,000.

ruin. Then there were \$13,000,000 of fractional silver and minor coins, a large part of which was worn and unavailable, while the rest was needed for currency purposes throughout the country. \$14,000,000 had been received from the sale of the Pacific Railroads; but although this sum was temporarily available it would, if it were spent, be necessary to raise an equivalent amount before January first to meet the Pacific Railroad bonds which came due at that time. \$33,000,000 were held in trust for the redemption of the notes of national banks which had failed or which were redeeming their circulation. A part of this was temporarily available, but it would be necessary to replenish that fund at an early date if much were drawn from it. There were then, out of the \$225,000,000, \$160,000,000, of which a small part only was available, and that but for a short time. Anything drawn upon that would have to be replaced by January first at latest. Of the \$65,000,000 remaining, \$40,000,000 were necessary as the cash on hand for the ordinary operations of the government. That amount corresponds to the cash on hand which a merchant keeps in the till to make change or to meet small bills. This left but \$25,000,000 for the initial expenses of the war, which in the state of unpreparedness would naturally be above the average. This \$25,000,000 was all the unincumbered money in the Treasury to meet the appropriation of \$50,000,000 made by Congress

before war was declared. It was clear that the Secretary of the Treasury could not provide the sinews of war without the power to borrow, both for a short time, to anticipate the revenues expected from the new taxes, and for a long time to enable him to support any naval and military operations which might become necessary, however extensive.

SEC. 9. After much discussion and more or less unnecessary and dangerous delay, especially in the Senate, Congress authorised the borrowing, at the discretion of the administration, of not more than \$100,000,000 at one time on Treasury certificates and of an amount not to exceed \$400,000,000 on 10-20 bonds at 3 per cent. Nominally, therefore, the Secretary of the Treasury had in his hands for the necessities of war during the first six months of its duration :

*Authority
to borrow
granted.*

Surplus on hand	.	.	.	.	\$ 25,000,000
War revenues	.	.	.	.	75,000,000
Temporary loans	.	.	.	.	100,000,000
Bonds	.	.	.	.	400,000,000
Total	.	.	.	.	<u>\$600,000,000</u>

Practically, he was limited by the fact that all of this money had not been appropriated, and it would have been folly to raise more than he had authority to spend. Including the \$50,000,000 appropriated before the war broke out, the total war appropriations made by Congress before it adjourned amounted in all to \$361,788,095.11. This sum covered the most

generous estimates of the probable cost of the war. But the Secretary did not deem it necessary to raise at once a sum equal to the total appropriations. It was estimated that the expenses for the first six months would not exceed \$175,000,000, or about one-half of the appropriations. The new taxes would probably yield about \$75,000,000 toward these necessities, and a loan of \$100,000,000 would possibly have sufficed to meet all the demands. But the Treasury raised \$200,000,000 by the sale of 3 per cent 10-20 bonds, obtaining a total of \$275,000,000, or nearly \$100,000,000 in excess of the probable actual expenditure. The accumulation of this surplus was not in any sense an extravagant or useless piece of financiering. As has already been explained, the Treasury must be prepared to meet any demand that may arise, instantly and amply. That is the imperative necessity. As the early close of the war could not have been foreseen, the fiscal preparations were necessarily liberal. Indeed, the amplitude of the funds available was one of the most potent causes of the success of the war. The excess raised was not larger than was necessary to insure the instant readiness of the Treasury to meet all possible demands. Had the war continued and the demands equalled the appropriations, the Treasury would again have been obliged to use its power of borrowing which the fortunate termination of the war rendered unnecessary.

*Determina-
tion of the
amount to be
borrowed.*

SEC. 10. It now remains to see how the credit of the nation was protected and how it stood the strain. At the end of April, 1898, the interest-bearing debt of the United States amounted in round numbers to \$847,000,000. \$100,000,000 of this bore

Use of the power to borrow, and preservation of the public credit.

interest nominally at 5 per cent, the balance at 4 per cent. The 4 per cent bonds, payable in 1925, were quoted, when the plans were being made for placing the new loan at $117\frac{1}{4}$. At that rate they would yield the investor $3\frac{1}{4}$ per cent interest. There was, therefore, some surprise when it was proposed to place the new loan at 3 per cent. It was urged that nobody would buy the new bond at 3 per cent when he could buy one of the old ones and get $3\frac{1}{4}$ per cent. Yet the outcome showed the wisdom of the move. The bonds were subscribed to seven times over, and in a short time rose to a premium of 103 and 105. In fact, the entire loan was easily placed on far better terms than any nation has ever before been able to obtain in time of war. This remarkable result was attained partly by reason of the fact that the loan was offered for popular subscriptions and the bonds were for small amounts, thus creating and reaching a new market among investors of small means. In part, too, it was due to the fact that the new bonds at par really formed a better basis for the national bank-note circulation than the old bonds at $117\frac{1}{4}$, and very much better than the old bonds at $123\frac{1}{4}$, the price which was

reached before the new issue was completed. An investment by a national bank of \$100,000 in the old bonds at 117 $\frac{1}{4}$ would yield a profit of \$736.70 on the circulation, if interest is at 6 per cent; while an investment of the same amount in the new bonds at par would yield a profit on the circulation of \$1,302.02. The difference in favour of the new bonds was \$565.32, or over half of 1 per cent. The advantage was still greater when the old 4's reached 127 $\frac{1}{2}$, as they did before the close of the war. None of these influences, however, would have had any weight had it not been that new revenues sufficient to meet all debt charges and part of the war expenses had been provided.

SEC. 11. Much interest centres around the successful attempt to make this a popular loan, and as this was one of the features which contributed to strengthen the credit of the country at this time, we may examine it somewhat in detail. Congress, after much discussion, finally provided that these 3 per cent bonds, "redeemable in coin at the pleasure of the United States after ten years from the date of their issue, and payable twenty years from that date," should "be first offered at par as a popular loan under such regulations, prescribed by the Secretary of the Treasury, as will give opportunity to the citizens of the United States to participate in the subscriptions to such loan, and in allotting such bonds the several subscriptions of individuals shall be first accepted,

and the subscriptions for the lowest amounts shall be first allotted." Before the bill was finally passed, offers had been made by various banking houses to take the whole issue at a slight premium. Both Congress and the administration, however, favoured the experiment of interesting a large number of small property-owners in the loan, even at a loss to the government. It was thought that such a measure would strengthen the national credit by giving expression to the faith of our own people in the integrity of the government. Other considerations of a political character also entered in, but with them we are not concerned. As a financial measure for the strengthening and support of the public credit it proved a phenomenal success.

The bonds were issued in denominations as low as \$20. Subscriptions were received through the post-office, and every *bona fide* subscription under \$500 was immediately accepted. More than half of the entire issue was taken by 230,000 of these small subscriptions, and no subscription of more than \$4,500 was accepted. In all 320,000 persons offered or made subscriptions, and the total amount tendered the government was \$1,400,000,000. This

The rush for the new bonds. rush for the new bonds was not merely a matter of patriotism or sentiment.

During the progress of the subscriptions the price of the bonds advanced first to 102 and finally to 105½. They now stand at about 110. The lucky individuals whose subscriptions were

accepted made from 3 per cent to 5 per cent in a few days. The popularity of these bonds was greatly enhanced by the standing offers obtained by Secretary Gage from two syndicates to take the entire loan or any part of it that was not covered by the popular subscriptions.

This method of floating the loan will cost the government a considerable sum of money. In the first place, a possible premium is lost. How much that premium would have been cannot be estimated because the bonds were sold in a broader market than would have otherwise existed. But it would have been at least 2 per cent, for even at a higher rate the bonds offer a favourable basis for national bank-note circulation. That is, at least \$4,000,000 was lost at the beginning. Then the cost of handling the loan, paying the interest, etc., is increased considerably by the small size of the bonds and the large number of holders. It is just as much trouble to pay the 15 cent coupon of a \$20 bond as it is to pay the \$75 coupon of a \$10,000 bond. Yet in spite of all this, the placing of the \$200,000,000 loan of 1898 was one of the most successful pieces of financiering ever accomplished by the government. It demonstrated the perfect solvency of the government; it gave the country a financial prestige which went a long way toward hastening the end of the war; and it so strengthened credit of the government that, had the war unfortunately continued, it would

*The cost of
the popular
loan.*

have been able to obtain funds to almost any amount on the most favourable terms imaginable. With a 3 per cent bond selling at 105 during the actual continuance of military operations, a nation may safely regard its credit as unimpaired.

The final test of the success of the financial administration of a war is the preservation of the public credit.

MONOPOLIES AND TRUSTS

By RICHARD T. ELY, Ph.D., LL.D.

Since such prominence has been given the subject of Trusts in the public press, it may seem that the present interest in the topic has suggested this book; but, on the contrary, the author has been engaged on this and connected subjects for a number of years; it is the result of long-continued research, a complete and searching discussion, interesting and authoritative.

"It is admirable. It is the soundest contribution on the subject that has appeared." — Professor JOHN R. COMMONS.

"By all odds the best written of Professor Ely's works."

— Professor SIMON N. PATTEN, University of Pennsylvania.

THE ECONOMICS OF DISTRIBUTION

By JOHN A. HOBSON

Author of "The Evolution of Modern Capitalism," etc.

An analysis of those processes of bargaining through which economic distribution is conducted, the results of industrial co-operation being apportioned to the owners of the factors of production in its several stages.

IN PREPARATION

ESSAYS IN THE MONETARY HISTORY OF THE UNITED STATES

By CHARLES J. BULLOCK, Ph.D.

Assistant Professor of Political Economy, Williams College

The first of these three essays furnishes the first systematic attempt to supply an interpretation of the leading facts in the entire monetary history of the country, maintaining the thesis that during three centuries the agitation for cheap money has been due to the same underlying cause, namely the extension of settlements over unoccupied Western lands, and that consequently by a process of natural evolution we are now approaching its end; the two others are briefer and contain the results of original investigations into special topics—the early paper currency of the States of North Carolina and New Hampshire.
